1. Topological Spaces and Continuous Maps

1.1. Elementary Topology

Given an inner product on an \mathbb{R} -vector space $\langle \cdot, \cdot \rangle$, one can define a norm $\|x\| = \sqrt{\langle x, x \rangle}$. Given a norm, one can define a metric $d(x, y) = \|x - y\|$. Given a metric d on a set X, one can define open sets in X:

given $a \in X$ and r > 0, $B(a,r) := \{x \in X \mid d(x,a) < r\}$. Then for $A \subseteq X$, we say A is open in X when $\forall a \in A \exists r > 0$ such that $B(a,r) \subseteq A$. Equivalently, for all $a \in A$, there is $b \in X$, r > 0 such that $a \in B(b,r) \subseteq A$.

Remark

The set of open sets on a metric space is called the metric topology on X.

Open sets in a metric space satisfy the following:

- 1. \emptyset and X are open
- 2. arbitrary unions of open sets are open
- 3. finite intersections of open sets are open

Notation

For a set of sets S, the union of S is

$$\cup S \coloneqq \{x \,|\, \exists A \in S, x \in A\} = \bigcup_{A \in S} A$$

In the case that $S \neq \emptyset$, the intersection of S is

$$\cap S \coloneqq \{x \,|\, \forall A \in S, x \in A\} = \bigcap_{A \in S} A$$

Note

 $\cap S$ would contain all elements as the condition $\forall A \in \emptyset$ would be vacuously satisfied. If we are given a universal set X, and S is known to be a set of subsets of X, then $\cap \emptyset = X$.

Definition 1.1.1

Let X be a set. $\mathcal{T} \subseteq \mathcal{P}(X)$ is called a *topology* on X if

- 1. $\emptyset, X \in \mathcal{T}$
- 2. If $S \subseteq \mathcal{T}$ is nonempty, then $\cup S \in \mathcal{T}$
- 3. If $S \subseteq \mathcal{T}$ is nonempty and finite, then $\cap S \in \mathcal{T}$

The elements of \mathcal{T} are called the open sets of X. The closed sets are the compliments of the open sets.

Remark

To show 3 holds, it suffices to show the intersection of 2 open sets is open (by induction)

Definition 1.1.2

If X is a set, and \mathcal{T} is a topology on X, then (X,\mathcal{T}) is called a *topological* space

Remark

When $f: X \to Y$ is a map between metric spaces, f is continuous iff $f^{-1}(V)$ is open in X for every open set $V \subseteq Y$.

Definition 1.1.3

For a map $f: X \to Y$ between topological spaces, we say that f is continuous when $f^{-1}(V)$ is open in X for every open set $V \subseteq Y$.

Example 1.1.1

if $f:A\subseteq\mathbb{R}^n\longrightarrow B\subseteq\mathbb{R}^m$ is an elementary function, then f is continuous.

Definition 1.1.4

When S, T are topologies on X with $S \subseteq T$, we say that S is coarser than T and T is finer than S. When $S \subseteq T$, we use strictly coarser/finer.

Example 1.1.2

 $\{\emptyset, X\}$ is a topology on X called the *trivial topology*

Example 1.1.3

 $\mathcal{P}(X)$ is a topology on X called the *discrete topology*

Example 1.1.4

When $X = \emptyset$, $\mathcal{T} \subseteq \mathcal{P}(X) \Rightarrow \mathcal{T} \subseteq \{\emptyset\} \Rightarrow \mathcal{T} = \emptyset \lor \mathcal{T} = \{\emptyset\}$. Thus the only topology on \emptyset is $\{\emptyset\}$.

Example 1.1.5

When $X = \{a\}$ the only topology is $\mathcal{T} = \{\emptyset, \{a\}\}$

Exercise 1.1.1

Find all topologies on the 2 and 3 element sets.

Definition 1.1.5

Let X be a topological space. Let $A \subseteq X$.

- 1. The *interior* of A (in X) denoted by A° is the union of all open sets in X which are contained in A.
- 2. The *closure* of A denoted \overline{A} is the intersection of all closed sets in X which contain A.
- 3. The *boundary* of A, denoted by ∂A , given by $\partial A = \overline{A} \setminus A^{\circ}$

Note

The set of closed sets in a topological space is closed under arbitrary intersections and under finite unions. In particular \emptyset , X are closed

Theorem 1.1.1

Let X be a topological space, $A \subseteq X$.

- 1. A° is open, and is the largest open set which is contained in A
- 2. \overline{A} is closed, and is the smallest closed set which contains A
- 3. A is open iff $A = A^{\circ}$
- 4. A is closed iff $A = \overline{A}$
- 5. $A^{\circ \circ} = A^{\circ}$
- 6. $\overline{A} = \overline{A}$

Definition 1.1.6

Let X be a topological space, let $A \subseteq X$, let $a \in X$.

- 1. We say that a is an *interior point* of A when $a \in A$ and there is an open set U such that $a \in U \subseteq A$
- 2. We say that a is a *limit point* of A when for every open set $U \ni a$ we have $U \cap (A \setminus \{a\}) \neq \emptyset$. The set of limit points of A is denoted by A'
- 3. We say that a is a boundary point of A when every open set $U\ni a$, we have $U\cap A\neq\emptyset$ and $U\cap A^c\neq\emptyset$

Theorem 1.1.2

Let X be a topological space and let $A \subseteq X$.

- 1. A° is equal to the set of all interior points
- 2. For $a \in X$,

$$a \in A' \Longleftrightarrow a \in \overline{A \smallsetminus \{a\}}$$

- 3. A is closed iff $A' \subseteq A$
- 4. $\overline{A} = A \cup A'$
- 5. \overline{A} is the disjoint union

$$\overline{A} = A^{\circ} \sqcup \partial A$$

6. ∂A is equal to the set of boundary points of A

1.2 Topological Bases

Theorem 1.2.1

Let X be a set. Then the intersection of any set of topologies on X is also a topology on X.

Proof: Let $\{\mathcal{T}_{\alpha}\}_{{\alpha}\in I}$ be a collection of topologies on X. Let $\mathcal{T}=\cap_{\alpha}\mathcal{T}_{\alpha}$

- 1. Since $X, \emptyset \in \mathcal{T}_{\alpha}$ for all $\alpha \in I$. We have $X, \emptyset \in \mathcal{T}$
- 2. Let $\{U_i\} \subseteq \mathcal{T}$. For all $\alpha \in I$, we have each $U_i \in \mathcal{T}_{\alpha}$. Thus $\cup_i U_i \in \mathcal{T}_{\alpha} \Longrightarrow \cup_i U_i \in \mathcal{T}$ as desired.
- 3. Let $U_1,...,U_n\in\mathcal{T}$. Then again for all $\alpha\in I$, we have each $U_i\in\mathcal{T}_{\alpha}$. Thus $\cap_{i=1}^n U_i\in\mathcal{T}_{\alpha}\Longrightarrow\cap_{i=1}^n U_i\in\mathcal{T}$

Corollary 1.2.2

When X is a set and \mathcal{S} is any set of subsets of X (that is $S \subseteq \mathcal{P}(X)$), there is a unique smallest (coarsest) topology \mathcal{T} on X which contains \mathcal{S} . Indeed \mathcal{T} is the intersection of (the set of) all topologies on X containing \mathcal{S} .

This topology \mathcal{T} is called the topology on X generated by \mathcal{S}

Definition 1.2.1

Let X be a set. A *basis of sets* on X is a set \mathcal{B} of subsets of X (So $\mathcal{B} \subseteq \mathcal{P}(X)$) such that

- 1. \mathcal{B} covers X, that is $\cup \mathcal{B} = X$
- 2. For every $C, D \in \mathcal{B}$ and $a \in C \cap D$. There is $B \in \mathcal{B}$ such that $a \in B \subseteq C \cap D$.

When \mathcal{B} is a basis of sets in X and \mathcal{T} is the topology on X generated by \mathcal{B} , we say that \mathcal{B} is a *basis for* \mathcal{T} . The elements in \mathcal{B} are called *basic open sets* in X.

Theorem 1.2.3 Characterization of Open Sets in Terms of Basic Open Sets

Let X be a topological space, Let \mathcal{B} be a basis for the topology on X.

- 1. For $A \subseteq X$, A is open iff for every $a \in A$, there is $B \in \mathcal{B}$ such that $a \in B \subseteq A$
- 2. The open sets in X are the unions of (sets of) elements in $\mathcal B$

Topological Bases 6

Proof: Let \mathcal{T} be the topology on X (generated by \mathcal{B}). Let \mathcal{S} be the set of all sets $A\subseteq X$ with the property ($\forall a\in A\exists B\in\mathcal{B}: a\in B\subseteq A$). And let \mathcal{R} be the set of (arbitrary) unions of (sets of) elements in \mathcal{B} . Recall that \mathcal{T} is the intersection of the set of all topologies on X which contain \mathcal{B} . Note that \mathcal{S} contains \mathcal{B} (obviously). Let us show that \mathcal{S} is a topology on X. We have $\emptyset\in\mathcal{S}$ vacuously and $X\in\mathcal{S}$ because \mathcal{B} covers X (given $a\in X$, we can choose $B\in\mathcal{B}$ with $a\in B$). When $U_k\in\mathcal{S}$ for every $k\in K$ (where K is any index set). Let $a\in \cup_k U_k$. Choose $\ell\in K$ so that $a\in U_\ell$. Since $U_\ell\in\mathcal{S}$, we can choose $B\in\mathcal{B}$ so that $a\in B\subseteq U_\ell$. Since $U_\ell\subseteq \cup_k U_k$, we have $a\in B\subseteq \cup_k U_k$. Thus $\cup_k U_k$ satisfies *, hence $\cup_k u_k\in\mathcal{S}$ as required. Suppose $U,V\in\mathcal{S}$ Let $a\in U\cap V$. Since $U\in\mathcal{S}$ we can choose $C\in\mathcal{B}$ with $a\in C\subseteq U$. Since $V\in\mathcal{S}$, we can choose $D\in\mathcal{B}$ with $a\in D\subseteq V$. Since \mathcal{B} is a basis, $C,D\in\mathcal{B}$ and $a\in C\cap D$, we can choose $B\in\mathcal{B}$ with $a\in B\subseteq C\cap D$. Then we have

$$a \in B \subset C \cap D \subset U \cap V$$

Thus $U \cap V$ satisfies * so that $U \cap V \in \mathcal{S}$ as required. Thus \mathcal{S} is a topology on X containing \mathcal{B} , hence $\mathcal{T} \subseteq \mathcal{S}$. Let us show that $\mathcal{S} \subseteq \mathcal{R}$ let $U \in \mathcal{S}$. For each $a \in U$, choose $B_a \in \mathcal{B}$ with $a \in B_a \subseteq U$. Then we have

$$U = \bigcup_{a \in U} B_a \in \mathcal{R}$$

Thus $\mathcal{S} \subseteq \mathcal{R}$. Finally note that $\mathcal{R} \subseteq \mathcal{T}$ because if $U = \bigcup_k B_k$ with $B_k \in \mathcal{B}$, then each $B_k \in \mathcal{T}$, and \mathcal{T} is a topology, so

$$U = \bigcup_{k \in K} B_k \in \mathcal{T}$$

Topological Bases
