1 Groups

1.1 Notation

- 1. $\mathbb{N} = \{1, 2, ...\}$
- 2. $\mathbb{Z} = \{..., -1, 0, 1, ...\}$
- 3. $\mathbb{Q} = \left\{ \frac{a}{b} : a \in \mathbb{Z}, b \in \mathbb{N} \right\}$
- 4. \mathbb{R} = real numbers
- 5. $\mathbb{C} = \{a + bi : a, b \in \mathbb{R}, i^2 = -1\}$

For $n\in\mathbb{N}$, $\mathbb{Z}_n=$ integers modulo $n=\{[0],...,[n-1]\}$ where $[r]=\{z\in\mathbb{Z}:Z\equiv r \ \mathrm{mod}\ n\}$ We note that the set $S=\mathbb{N},\mathbb{Z},\mathbb{Q},\mathbb{R},\mathbb{C},\mathbb{Z}_n$ has 2 operations $+,\cdot$.

For $n \in \mathbb{N}$, an $n \times n$ matrix over \mathbb{R} (or \mathbb{Q} or \mathbb{C}) is an $n \times n$ array

$$A = \begin{bmatrix} a_{ij} \end{bmatrix} = \begin{bmatrix} a_{11} & \dots & a_{1n} \\ \vdots & \ddots & \vdots \\ a_{n1} & \dots & a_{nn} \end{bmatrix}$$

with $a_{ij} \in \mathbb{R}$.

Note we can also do $+, \cdot$. For $A, B \in M_n(\mathbb{R})$

$$A + B := \begin{bmatrix} a_{ij} + b_{ij} \end{bmatrix} \quad A \cdot B := \begin{bmatrix} \sum_{k=1}^{n} a_{ik} b_{kj} \end{bmatrix}$$

1.2 Groups

Definition 1.2.1

Let G be a set and $*: G \times G \to G$. We say G is a group if the following are satisfied:

- 1. Associativity: if $a, b, c \in G$, then a * (b * c) = (a * b) * c
- 2. Identity: there is $e \in G$ such that a * e = e * a = a for all $a \in G$
- 3. Inverses: for all $a \in G$, there is $a^{-1} \in G$ such that $a * a^{-1} = a^{-1} * a = e$

Definition 1.2.2

A group is called *abelian* if a * b = b * a for all $a, b \in G$

Exercise 1.2.1

Prove in the definition of a group, 1-sided identity and inverses are enough to have 2-sided identity and inverses

Proposition 1.1

previous exercise

Suppose G is a set, $*: G \times G \to G$ is associative. Suppose there is $e \in G$ such that e * a = a for all $a \in G$. Further suppose that for every $a \in G$, there is $a^{-1} \in G$ such that $a^{-1} * a = e$. Then for all $a \in G$,

1.
$$a * e = a$$

2.
$$a * a^{-1} = e$$

Proof of 1: Let $a \in G$, then

$$a^{-1} * a * e = e * e = e = a^{-1} * a$$

Multiplying on the left by a^{-1} gives

$$a^{-1^{-1}} * a^{-1} * a * e = a^{-1^{-1}} * a^{-1} * a$$

$$\implies e * a * e = e * a$$

$$\implies a * e = a$$

Proof of 2: Let $a \in G$, then

$$a^{-1}*a*a^{-1}=e*a^{-1}=a^{-1}$$

Again multiplying on the left by a^{-1} gives

$$a * a^{-1} = e$$

Proposition 1.2

Let G be a group, let $a \in G$. Then

- 1. The group identity is unique
- 2. The inverse of a is unique

Proof of 1: Suppose e_1, e_2 are both identities. Then

$$e_1 = e_1 * e_2 = e_2$$

Proof of 2: Suppose b_1, b_2 are inverses of a. Then

$$b_1 = b_1 * e = b_1 * (a * b_2) = (b_1 * a) * b_2 = e * b_2 = b_2$$

Example 1.2.1

 $(\mathbb{Z},+),(\mathbb{Q},+),(\mathbb{R},+),(\mathbb{C},+)$ are all abelian groups

Example 1.2.2

 $(\mathbb{Z},\cdot),(\mathbb{Q},\cdot),(\mathbb{R},\cdot),(\mathbb{C},\cdot)$ are not groups as 0 has no inverse

Example 1.2.3

but $(\mathbb{Q} \setminus \{0\}, \cdot), (\mathbb{R} \setminus \{0\}, \cdot), (\mathbb{C} \setminus \{0\}, \cdot)$ are abelian groups

Definition 1.2.3

For a set (S, \cdot) let $S^* \subseteq S$ denote the set of all elements with inverses.

Exercise 1.2.2

what is \mathbb{Z}_n^* ?

Example 1.2.4

 $(M_n(\mathbb{R}),+)$ is an abelian group.

Example 1.2.5

 $\begin{array}{l} \text{Consider } \left(M_{n(\mathbb{R})},\cdot\right) \text{ The identity matrix is } \begin{bmatrix} 1 & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & 1 \end{bmatrix} \in M_n(\mathbb{R}) \\ \text{However, since not all } \\ M \in M_n(\mathbb{R}) \text{ have multiplicative inverses, } \left(M_n(\mathbb{R}),\cdot\right) \text{ is not a group.} \end{array}$

Notation

$$\operatorname{GL}_n(\mathbb{R}) = \{ M \in M_n(\mathbb{R}) : \det(M) \neq 0 \}$$

Note

If $A,B\in \mathrm{GL}_n(\mathbb{R})$, then $\det(AB)=\det(A)\det(B)\neq 0$ Thus $AB\in \mathrm{GL}_n(\mathbb{R})$. The associativity of $\mathrm{GL}_n(\mathbb{R})$ inherits from $M_n(\mathbb{R})$. Also the identity matrix satisfies $\det(I)=1\neq 0$ and thus $I\in \mathrm{GL}_n(\mathbb{R})$. Finally, for $M\in \mathrm{GL}_n(\mathbb{R})$, there exists $M^{-1}\in M_n(\mathbb{R})$ such that $MM^{-1}=I=M^{-1}M$ since $\det(M^{-1})=\frac{1}{\det(M)}\neq 0$, we have $M^{-1}\in \mathrm{GL}_n(\mathbb{R})$. Thus $(\mathrm{GL}_n(\mathbb{R}),\cdot)$ is a group, called the general linear group of degree n over \mathbb{R}

Note

if $n \geq 2$, then $\operatorname{GL}_n(\mathbb{R})$ is not abelian.

Exercise 1.2.3

What is $(GL_1(\mathbb{R}), \cdot)$?

PMATH 347 Fall 2025 JAKE EDMONSTONE

Example 1.2.6

Let G, H be groups. The *direct product* is the set $G \times H$ with the component wise operation defined by

$$(g_1,h_1)*(g_2,h_2)=(g_1*_Gg_2,h_1*_Hh_2)$$

One can check that $G \times H$ is a group with identity (e_G, e_H) and the inverse of (g, h) is (g^{-1}, h^{-1})

Note

One can show by induction that if $G_1, ..., G_n$ are groups, then $G_1 \times \cdots \times G_n$ is also a group.

Notation

Given a group G and $g_1, g_2 \in G$, we often denote $g_1 * g_2$ by g_1g_2 and its identity by 1. Also the unique inverse of an element $g \in G$ is denoted by g^{-1} . Also for $n \in \mathbb{N}$, we define $g^n = g * g * \cdots * g$ (n-times) and $g^{-n} = (g^{-1})^n$. Finally, we denote $g^0 = 1$.

Proposition 1.3

Let G be a group and $g, h \in G$ we have

1.
$$q^{-1-1} = q$$

2.
$$(qh)^{-1} = h^{-1}q^{-1}$$

1.
$$g^{-1-1} = g$$

2. $(gh)^{-1} = h^{-1}g^{-1}$
3. $g^ng^m = g^{n+m}$ for all $n, m \in \mathbb{Z}$

4.
$$(g^n)^m = g^{nm}$$
 for all $n, m \in \mathbb{Z}$

Proof of 1: Since

$$g^{-1}g = 1 = gg^{-1}$$

so $g^{-1^{-1}} = g$

Proof of 2:

$$(gh)\big(h^{-1}g^{-1}\big)=g\big(hh^{-1}\big)g^{-1}=g1g^{-1}=1$$

Similarly,

$$\left(h^{-1}g^{-1}\right)(gh)=1$$

Thus $(gh)^{-1} = h^{-1}g^{-1}$

Proof of 3: We proceed by considering cases:

1. if n = 0 then

$$q^n q^m = q^0 q^m = 1q^m = q^m = q^{0+m} = q^{n+m}$$

2. if n > 0, we will proceed by induction on n. Case 1 establishes the base case. Let $m \in \mathbb{Z}$, $n \in \mathbb{Z}_{>0}$. Suppose that $g^n g^m = g^{n+m}$ Then

$$g^{n+1}g^m = gg^ng^m = gg^{n+m} = g^{n+m+1}$$

3. if n < 0, then n = -k for some $k \in \mathbb{N}$. We have

$$g^k g^n g^m = g^{k+n} g^m = g^0 g^m = g^m$$

also

$$g^k g^{n+m} = g^{k+m+n} = g^m$$

Thus

$$g^k g^n g^m = g^k g^{n+m}$$

So

$$g^n g^m = g^{n+m}$$

as desired.

Proof of 4: We proceed by considering cases:

- 1. if m = 0, then $(g^n)^m = (g^n)^0 = 1 = g^0 = g^{n0} = g^{nm}$
- 2. if m > 0, then

$$(g^n)^m = \underbrace{g^n g^n \cdots g^n}_{m \text{ times}} = g^{nm}$$

3. if m < 0, then m = -k for some $k \in \mathbb{N}$. We will induct on k. For k = 1 we see that $(g^n)^{-1} = g^{-n}$ since

$$g^n g^{-n} = g^{n-n} = g^0 = 1$$

Suppose $(g^n)^{-\ell} = g^{-n\ell}$ for all $1 \le \ell \le k$ Then

$$\left(g^{n}\right)^{-k-1}=\left(g^{n}\right)^{-k}\!\left(g^{n}\right)^{-1}=g^{-nk}g^{-n}=g^{-nk-n}=g^{-n(k+1)}$$

Exercise 1.2.4

prove 3,4

Warning

In general, it is not the case that if $g,h\in G$ then $(gh)^n=g^nh^n$, this is not true unless G is abelian

Proposition 1.4

Let G be a group and $g, h, f \in G$ Then

- 1. They satisfy the left and right cancellation. More precisely,
 - a. if gh = gf then h = f
 - b. if hg = fg then h = f
- 2. Given $a, b \in G$ the equations ax = b and ya = b have unique solutions for $x, y \in G$

Proof of 1-a: By left-multiplying by q^{-1} , we have

$$gh = gf \iff g^{-1}gh = g^{-1}gf \iff h = f$$

Proof of 1-b: similar to 1-a **Proof of 2:** Let $x = a^{-1}b$ then

$$ax = aa^{-1}b = b$$

If u is another solution, then au=b=ax. By 1-a, u=x. Similarly, $y=ba^{-1}$ is the unique solution of ya=b

1.3 Symmetric Groups

Definition 1.3.1

Given a non-empty set L, a permutation of L is a bijection from L to L. The set of all permutations of L is denoted by S_L

Example 1.3.1

Consider the set $L = \{1, 2, 3\}$ which has the following different permutations

$$\binom{123}{123}, \binom{123}{132}, \binom{123}{213}, \binom{123}{231}, \binom{123}{312}, \binom{123}{321}$$

Where $\binom{123}{123}$ denotes the bijection

$$\sigma:\{1,2,3\}\longrightarrow\{1,2,3\}$$

$$\sigma(1)=1, \sigma(2)=2, \sigma(3)=3$$

Notation

For $n\in\mathbb{N}$ we denote by $S_n=S_{\{1,2,\dots,n\}}$ the set of all permutations of $\{1,2,\dots,n\}$. We have seen that the order of $S_3=3!=6$. To consider the general S_n , we note that for a permutation $\sigma\in S_n$, there are n choices for $\sigma(1),\,n-1$ choices for $\sigma(2),\dots$, 1 choice for $\sigma(n)$ Thus

Proposition 1.5

$$|S_n| = n!$$

Symmetric Groups 7

Note

For Möbius quizzes, use "9 dots" for permutations.

Remark

Given $\sigma, \tau \in S_n$ we can compose them to get a new element $\sigma\tau$, where $\sigma\tau = \{1,2,...,n\} \to \{1,2,...,n\}$ given by $x \mapsto \sigma(\tau(x))$ Since both σ,τ are bijections, $\sigma\tau \in S_n$

Example 1.3.2

Compute $\sigma \tau$ and $\tau \sigma$ if

$$\sigma = \begin{pmatrix} 1234 \\ 3412 \end{pmatrix}, \quad \tau = \begin{pmatrix} 1234 \\ 2431 \end{pmatrix}$$

Then $\sigma \tau(1)=\sigma(2)=4,...$ Then $\sigma \tau=\binom{1234}{4213},$ and $\tau \sigma=\binom{1234}{3124}$ We note that $\sigma \tau \neq \tau \sigma$

Note

For any $\sigma, \tau \in S_n$ we have that $\tau\sigma, \sigma\tau \in S_n$ but $\sigma\tau \neq \tau\sigma$ in general on the other hand, for any σ, τ, μ we have $\sigma(\tau\mu) = (\sigma\tau)\mu$. Also note the *identity permutation* $\varepsilon \in S_n$ is defined as

$$\varepsilon = \begin{pmatrix} 12 \cdots n \\ 12 \cdots n \end{pmatrix}$$

Thus for any $\sigma \in S_n$, we have $\sigma \varepsilon = \varepsilon \sigma = \sigma$

Finally, for $\sigma \in S_n$, since it is a bijection, there is a unique bijection $\sigma^{-1} \in S_n$ called the *inverse permutation* of σ such that for all $x, y \in \{1, 2, ..., n\}$

$$\sigma^{-1}(x) = y \Longleftrightarrow \sigma(y) = x$$

It follows that

$$\sigma(\sigma^{-1}(x)) = \sigma(y) = x$$

and

$$\sigma^{-1}(\sigma(y)) = y$$

i.e we have

$$\sigma\sigma^{-1}=\sigma^{-1}\sigma=\varepsilon$$

Symmetric Groups 8

Example 1.3.3

$$\sigma = \binom{12345}{45123}$$

Then

$$\sigma^{-1} = \binom{12345}{34512}$$

From the above we have

Proposition 1.6

 (S_n, \circ) is a group, called the *symmetric group of degree* n

Exercise 1.3.1

Write down all rotations and reflections that fix an equilateral triangle. Then check why it is the "same" as S_3

Example 1.3.4

Consider

$$\sigma = \begin{pmatrix} 123456789(10) \\ 317694258(10) \end{pmatrix} \in S_{10}$$

We note that $1 \to 3 \to 7 \to 2 \to 1$ and $4 \to 6 \to 4$ and $5 \to 9 \to 8$ and $10 \to 10$ Thus σ can be *decomposed* into one 4-cycle (1372), one 2-cycle (46), and one 3-cycle (598) and one 1-cycle (10) (we usually do not write 1-cycles) Note that these cycles are *pairwise disjoint* and we have

$$\sigma = (1372)(46)(598)$$

We can also write $\sigma = (46)(598)(1372)$, or $\sigma = (64)(985)(7213)$

Theorem 1.7

Cycle Decomposition

If Given $\sigma \in S_n$ with $\sigma \neq \varepsilon$, then σ is a product of (one or more) disjoint cycles of length at least 2. This factorization is unique up to the order of the factors.

Proof: See bonus 1.

Convention

Every permutation of S_n can be regarded as a permutation in S_{n+1} by fixing the number n+1, thus

$$S_1 \subseteq S_2 \subseteq \dots \subseteq S_n \subseteq S_{n+1}$$

Symmetric Groups 9

1.4 Cayley Tables

Definition 1.4.1

For a finite group G, defining its operation by means of a table is sometimes convenient. Given $x, y \in G$, the product xy is the entry of the table in the row corresponding to x and the column corresponding to y, such a table is a *Cayley table*.

Remark

By cancellation, the entries in each row or column of a Cayley table are all distinct

Example 1.4.1

Consider $(\mathbb{Z}_2, +)$ its Cayley table is

$$\begin{array}{c|cccc} \mathbb{Z}_2 & [0] & [1] \\ \hline [0] & [0] & [1] \\ \hline [1] & [1] & [0] \\ \end{array}$$

Example 1.4.2

Consider the group $\mathbb{Z}^* = \{1, -1\}$. Its Cayley table is

$$\begin{array}{c|cccc} \mathbb{Z}^* & 1 & -1 \\ 1 & 1 & -1 \\ -1 & -1 & 1 \end{array}$$

Note

If we replace 1 by [0] and -1 by [1] the Cayley tables of \mathbb{Z}^* and \mathbb{Z}_2 become the same. In this case, we say \mathbb{Z}^* and \mathbb{Z}_2 are *isomorphic* denoted by

$$\mathbb{Z}^* \cong \mathbb{Z}_2$$

Cayley Tables 10

Example 1.4.3

For $n \in \mathbb{N}$, the *cyclic group of order* n is defined by

$$C_n = \left\{1, a, a^2, ..., a^{n-1}\right\}$$
 with $a^n = 1$ and $1, a, ..., a^{n-1}$ are distinct

The Cayley table of C_n is as follows

C_n	1	a	a^2		a^{n-2}	a^{n-1}
1	1	a	a^2	•••	a^{n-2}	a^{n-1}
\overline{a}	a	a^2	a^3		a^{n-1}	1
a^2	a^2	a^3	a^4		1	a
:	:	:	:	٠.	:	:
a^{n-2}	a^{n-2}	a^{n-1}	1		a^{n-4}	a^{n-3}
a^{n-1}	a^{n-1}	1	a		a^{n-3}	a^{n-2}

Proposition 1.8

Let G be a group. Up to isomorphism, we have

- 1. If |G| = 1, then $G \cong \{1\}$
- 2. If |G| = 2, then $G \cong C_2$
- 3. If |G| = 3, then $G \cong C_3$
- 4. If |G|=4, then $G\cong C_4$ or $G\cong K_4\cong C_2\times C_2$

Proof of 1: obviously

Proof of 2: If |G|=2 then $G=\{1,g\}$ with $g\neq 1$ Then $g^2=g$ or $g^2=1$. We note that if $g^2=g$, then g=1 contradiction.thus $g^2=1$. Thus the Cayley table is as follows

$$egin{array}{c|c|c|c} G & 1 & g \\ \hline 1 & 1 & g \\ \hline g & g & 1 \\ \hline \end{array}$$

which is the same as C_2

Proof of 3: If |G|=3, then $G=\{1,g,h\}$ with $g\neq 1, h\neq 1, g\neq h$ By cancellation, we have $gh\neq g, gh\neq h$, thus gh=1. Similarly, we have hg=1. Also, on the row for g, we have g1=g, gh=1. Since all entries in this row are distinct, we have $g^2=h$. Similarly, we have $h^2=g$. Thus we obtain the following Cayley table

G	1	g	h
1	1	g	h
g	g	h	1
\overline{h}	h	1	g

Which is the same as C_3 .

Proof of 4: See assignment 1

Cayley Tables 11

Exercise 1.4.1

Consider the symmetry group of a non-square rectangle. How is it related to K_4 ?

2 Subgroups

2.1 Subgroups

Definition 2.1.1

Let G be a group and $H \subseteq G$. If H itself is a group, then we say H is a *subgroup* of G.

Note

We note that since G is a group, for $h_1, h_2, h_3 \in H \subseteq G$, we have

$$h_1(h_2h_3) = (h_1h_2)h_3$$

Thus

Proposition 2.1

Subgroup Test

Let G be a group, $H \subseteq G$. Then H is a subgroup of G if

- 1. If $h_1, h_2 \in H$, then $h_1 h_2 \in H$
- 2. $1_H \in H$
- 3. If $h \in H$, then $h^{-1} \in H$

Exercise 2.1.1

Prove that $1_H = 1_G$

Example 2.1.1

Given a group G, then $\{1\}$, G are subgroups of G

Example 2.1.2

We have a chain of groups

$$(\mathbb{Z},+)\subseteq (\mathbb{Q},+)\subseteq (\mathbb{R},+)\subseteq (\mathbb{C},+)$$

Subgroups 12

Example 2.1.3

Define

$$\operatorname{SL}_n(\mathbb{R}) = (\operatorname{SL}_n(\mathbb{R}), \cdot) \coloneqq \{M \in M_n(\mathbb{R}), \det(M) = 1\} \subseteq \operatorname{GL}_n(\mathbb{R})$$

Note that the identity matrix $I \in \mathrm{SL}_n(\mathbb{R})$. Let $A, B \in \mathrm{SL}_n(\mathbb{R})$, then

$$\det(AB) = \det(A)\det(B) = 1 \cdot 1 = 1$$

and

$$\det(A^{-1}) = \frac{1}{\det(A)} = \frac{1}{1} = 1$$

i.e. $AB, A^{-1} \in \mathrm{SL}_n(\mathbb{R})$. By the subgroup test (Proposition 2.1), $\mathrm{SL}_n(\mathbb{R})$ is a subgroup of $\mathrm{GL}_n(\mathbb{R})$. We call $\mathrm{SL}_n(\mathbb{R})$ the special linear group of order n over \mathbb{R}

Definition 2.1.2

Given a group G, we define the *center of* G to be

$$Z(G) \coloneqq \{z \in G \,|\, zg = gz \,\,\forall g \in G\}$$

Remark

Z(G) = G iff G is abelian.

Proposition 2.2

Z(G) is an abelian subgroup of G.

Proof: Note that $1 \in Z(G)$. Let $y, z \in Z(G)$ Then for all $g \in G$, we have

$$(yz)g = y(zg) = y(gz) = (yg)z = (gy)z = g(yz)$$

Thus $yz \in Z(G)$. Also, for $z \in Z(G)$, $g \in G$ we have

$$zg = gz \iff z^{-1}(zg)z^{-1} = z^{-1}(gz)z^{-1}$$
$$\iff gz^{-1} = z^{-1}g$$

Thus $z^{-1} \in Z(G)$. By the subgroup test (Proposition 2.1), Z(G) is a subgroup of G. Also, by the definition of Z(G), we see that it is abelian.

Proposition 2.3

Let H, K be subgroups of a group G. Then $H \cap G$ is also a subgroup.

Proof: Exercise

Subgroups 13

Proposition 2.4

Finite Subgroup Test

If $H \neq \emptyset$ is a finite subset of a group G, then H is a subgroup of G iff H is closed under its operation.

Proof:

 (\Longrightarrow) obvious

(\Leftarrow) For $H \neq \emptyset$, let $h \in H$. Since H is closed under its operation, we have $h, h^2, h^3, ... \in H$. Since H is finite, these elements are not all distinct. Thus $h^n = h^{n+m}$ for some $n, m \in \mathbb{N}$. By cancellation, $h^m = 1$ and thus $1 \in H$. Also, $1 = h^{m-1}h$ implies that $h^{-1} = h^{m-1}$ and thus $h^{-1} \in H$. By the subgroup test, H is a subgroup of G.

2.2 Alternating Groups

Definition 2.2.1

A transposition $\sigma \in S_n$ is a cycle of length 2. i.e. $\sigma = (ab)$ with $a, b \in \{1, 2, ..., n\}$ and $a \neq b$.

Example 2.2.1

Consider $(1245) \in S_5$. Also the composition (12)(24)(45) can be computed as

$$\begin{pmatrix}
1 & 2 & 3 & 4 & 5 \\
1 & 2 & 3 & 5 & 4 \\
1 & 4 & 3 & 5 & 2 \\
2 & 4 & 3 & 5 & 1
\end{pmatrix}$$

Thus we have (1245) = (12)(24)(45) Also we can show that

$$(1245) = (23)(12)(25)(13)(24)$$

We see from this example that the factorization into transpositions are NOT unique. However, one can prove (see Bonus 2)

Theorem 2.5 Parity Theorem

If a permutation σ has two factorizations

$$\sigma = \gamma_1 \gamma_2 \cdots \gamma_r = \mu_1 \mu_2 \cdots \mu_s$$

Where each γ_i and μ_j is a transposition, then $r \equiv s \pmod{2}$

Definition 2.2.2

A permutation σ is *even* (or *odd*) if it can be written as a product of an even (or odd) number of transpositions. By the previous theorem, a permutation is either even or odd, but not both.

Alternating Groups 14

PMATH 347 Fall 2025 JAKE EDMONSTONE

Theorem 2.6

For $n \geq 2$, let A_n denote the set of all even permutations in S_n

- 1. $\varepsilon\in A_n$ 2. If $\sigma,\tau\in A_n$, then $\sigma\tau\in A_n$ and $\sigma^{-1}\in A_n$ 3. $|A_n|=\frac{1}{2}n!$

From (1) and (2), we see (A_n) is a subgroup of S_n called the alternating group of degree n.

Proof of 1: We can write $\varepsilon = (12)(12)$. Thus ε is even.

Proof of 2: if $\sigma, \tau \in A_n$ we can write $\sigma = \sigma_1 \cdots \sigma_r$ and $\tau = \tau_1 \cdots \tau_s$ where σ_i, τ_j are transpositions and r, s are even integers. Then

$$\sigma \tau = \sigma_1 \cdots \sigma_r \tau_1 \cdots \tau_s$$

is a product of (r+s) transpositions and thus $\sigma \tau \in A_n$. Also, we note that σ_i is a transposition, we have $\sigma_i^2 = \varepsilon$ and thus $\sigma_i^{-1} = \sigma_i$. It follows that

$$\sigma^{-1} = \left(\sigma_1 \cdots \sigma_r\right)^{-1} = \sigma_r^{-1} \cdots \sigma_1^{-1} = \sigma_r \cdots \sigma_1$$

which is an even permutation.

Proof of 3: Let O_n denote the set of odd permutations in S_n . Thus $S_n = A_n \cup O_n$ and the parity theorem implies that $A_n \cap O_n = \emptyset$. Since $|S_n| = n!$, to prove $|A_n| = \frac{1}{2}n!$, it suffices to show that $|A_n|=|O_n|$. Let $\gamma=(12)$ and let $f:A_n\to O_n$ be defined by $f(\sigma)=\gamma\sigma$. Since σ is even, we have $\gamma\sigma$ is odd. Thus the map is well-defined. Also, if we have $\gamma \sigma_1 = \gamma \sigma_2$, then by cancellation, we get $\sigma_1 = \sigma_2$, thus f is injective. Finally, if $\tau \in O_n$, then $\sigma = \gamma \tau \in A_n$ and $f(\sigma) = \gamma \sigma = \gamma(\gamma \tau) = \gamma^2 \tau = \tau$. Thus f is surjective. It follows that f is a bijection, thus $|A_n| = |O_n|$. It follows that $|A_n| = \frac{1}{2}n! = |O_n|$

2.3 Orders of Elements

Notation

If G is a group and $g \in G$, we denote

$$\langle g \rangle = \left\{ g^k \,\middle|\, k \in \mathbb{Z} \right\} = \left\{ ..., g^{-1}, g^0 = 1, g, g^2, ... \right\}$$

Note that $1 = g^0 \in \langle g \rangle$. Also, if $x = g^m, y = g^n \in \langle g \rangle$ With $m, n \in \mathbb{Z}$, then $xy = g^n g^m = g^{n+m} \in \langle g \rangle$ and $x^{-1} = g^{-m} \in \langle g \rangle$. By the subgroup test, we have

Proposition 2.7

If *G* is a group and $g \in G$, then $\langle g \rangle$ is a subgroup of *G*.

Definition 2.3.1

Let G be a group with $g \in G$. We call $\langle g \rangle$ the cyclic subgroup of G generated by g. If $G = \langle g \rangle$ for some $g \in G$, then we say G is cyclic and g a generator of G.

Orders of Elements 15 **PMATH 347 Fall 2025** JAKE EDMONSTONE

Example 2.3.1

Consider $(\mathbb{Z}, +)$ Note that for all $k \in \mathbb{Z}$, we can write $k = k \cdot 1$. Thus we can see $(\mathbb{Z}, +) = \langle 1 \rangle$. Similarly, $(\mathbb{Z}, +) = \langle -1 \rangle$. We observe, for any integer $n \in \mathbb{Z}$ with $n \neq \pm 1$ there exist no $k \in \mathbb{Z}$ such that $k \cdot n = 1$. Thus ± 1 are the only generators of $(\mathbb{Z}, +)$.

Remark

Let G be a group and $g \in G$. Suppose there is $k \in \mathbb{Z}$ $k \neq 0$ such that $g^k = 1$ then $g^{-k} = (g^k)^{-1} = 1$. Thus we can assume $k \ge 1$. Then by the well-ordering principle, there exists the smallest positive integer n such that $g^n = 1$

Definition 2.3.2

Let G be a group and $g \in G$. If n is the smallest positive integer such that $g^n = 1$, then we say the order of g is n, denoted o(g) = n. If no such n exists, we say g has infinite order and write $o(g) = \infty$

Proposition 2.8

Let G be a group and $g \in G$ with $o(g) = n \in \mathbb{N}$. For $k \in \mathbb{Z}$ we have

- 2. $g^k=g^m$ iff $k\equiv m\pmod n$ 3. $\langle g\rangle=\{1,g,g^2,...,g^{n-1}\}$ where $1,g,...,g^{n-1}$ are all distinct. In particular, we have

Proof of 1:

 (\Leftarrow) if $n \mid k$, then k = nq for some $q \in \mathbb{Z}$. Thus

$$g^k = g^{nq} = (g^n)^q = 1^q = 1$$

 (\Longrightarrow) By the division algorithm, we can write k = nq + r with $q, r \in \mathbb{Z}$ and $0 \le r < n$. Since $g^k = 1$ and $q^n = 1$, we have

$$g^r = g^{k-nq} = g^k(g^n)^{-q} = 1 \cdot 1^{-q} = 1$$

Since $0 \le r < n$ and o(g) = n, we have r = 0 and hence $n \mid k$.

Proof of 2: Note that $q^k = q^m$ iff $q^{km} = 1$. By (1), we have $n \mid (km)$ i.e. $k \equiv m \pmod{n}$

Proof of 3: It follows from (2) that $1, g, ..., g^{n-1}$ are all distinct. Clearly, we have $\{1, g, ..., g^{n-1}\} \subseteq \langle g \rangle$. To prove the other inclusion, let $g^k \in \langle g \rangle$ for some $k \in \mathbb{Z}$. Write k = nq + r with $n, r \in \mathbb{Z}$ and $0 \le r < n$. Then

$$g^k = g^{nq+r} = g^{nq}g^r = (g^n)^q g^r = 1^q g^r = g^r \in \{1, g, ..., g^{n-1}\}$$

Thus
$$\langle g \rangle = \{1, g, ..., g^{n-1}\}$$

Orders of Elements 16

Proposition 2.9

Let G be a group and $g \in G$ with $o(g) = \infty$. For $k \in \mathbb{Z}$ we have

- 1. $g^k = 1$ iff k = 0
- $2. \ g^k = g^m \text{ iff } k = m$
- 3. $\langle g \rangle = \left\{..., g^{-1}, g^0 = 1, g, ...\right\}$ where g^i are all distinct

Proposition 2.10

Let G be a group and $g \in G$ with $o(g) = n \in \mathbb{N}$. If $d \in \mathbb{N}$, then $o(g^d) = \frac{n}{\gcd(n,d)}$. In particular, if $d \mid n$, then $\gcd(n,d) = d$ and $o(g^d) = \frac{n}{d}$

Proof: Let $n_1=\frac{n}{\gcd(n,d)}$ and $d_1=\frac{d}{\gcd(n,d)}$. By a result from Math 135, we have $\gcd(n_1,d_1)=1$. Note that

$$\left(g^{d}\right)^{n_{1}} = \left(g^{d}\right)^{\frac{n}{\gcd(n,d)}} = \left(g^{n}\right)^{\frac{d}{\gcd(n,d)}} = 1$$

Thus it remains to show that n_1 is the smallest such positive integer. Suppose $\left(g^d\right)^r=1$ with $r\in\mathbb{N}$. Since o(g)=n, by proposition, we have $n\mid dr$. Thus there is $q\in\mathbb{Z}$ such that dr=nq. Dividing both sides by $\gcd(n,d)$ we get

$$d_1r = \frac{d}{\gcd(n,d)}r = \frac{n}{\gcd(n,d)}q = n_1q$$

Since $n_1 \mid d_1 r$ and $\gcd(n_1, d_1) = 1$, by a result from Math 135, we get $n_1 \mid r$ i.e. $r = n_1 \ell$ for some $\ell \in \mathbb{Z}$. Since $r_1, n_1 \in \mathbb{N}$, it follows that $\ell \in \mathbb{N}$. Since $\ell \geq 1$, we get $r \geq n_1$

2.4 Cyclic Groups

Remark

For a group G, if $G = \langle g \rangle$ for some $g \in G$, then G is a cyclic group. For $a, b \in G$, we have $a = g^n, b = g^m$ for some $m, n \in \mathbb{Z}$. We have

$$ab=g^ng^m=g^{n+m}=g^{m+n}=g^mg^n=ba$$

Proposition 2.11

Every cyclic group is abelian

Warning

The converse of the above proposition is not true. For example the Klein 4 group is abelian, but not cyclic.

Proposition 2.12

Every subgroup of a cyclic group is cyclic.

Cyclic Groups 17

Proof: Let $G = \langle g \rangle$ be cyclic and $H \subseteq G$ a subgroup. If $H = \{1\}$, then H is cyclic. Otherwise, there is $g^k \in H$ with $k \in \mathbb{Z} \setminus \{0\}$. Since H is a group, we have $g^{-k} \in H$. Thus we can assume that $k \in \mathbb{N}$. Let m be the smallest positive integer such that $g^m \in H$.

<u>Claim</u>: $H = \langle g^m \rangle$

Proof is exercise, by division algorithm.

Proposition 2.13

Let $G = \langle g \rangle$ be a cyclic group with o(g) = n. Then $G = \langle g^k \rangle$ iff $\gcd(k, n) = 1$.

Proof: By proposition,

$$o\big(g^k\big) = \frac{n}{\gcd(n,k)} = n$$

Theorem 2.14

Fundamental Theorem of Finite Cyclic Groups

Let $G = \langle g \rangle$ be a cyclic group with $o(g) = n \in \mathbb{N}$.

- 1. If H is a subgroup of G, then $G = \langle g^d \rangle$ for some $d \mid n$. It follows that $|H| \mid |G|$.
 - 2. Conversely, if $k \mid n$, then $\langle g^{\frac{n}{k}} \rangle$ is the unique subgroup of G with order k.

Proof of 1: By proposition, H is cyclic. Write $H = \langle g^n \rangle$ for some $m \in \mathbb{N} \cup \{0\}$. Let $d = \gcd(m, n)$. Claim: $H = \langle g^d \rangle$

Since $d \mid m$ we have m = dk for some $k \in \mathbb{Z}$. Then

$$g^m = g^{dk} = \left(g^d\right)^k \in \langle g^d \rangle$$

Thus $H=\langle g^m\rangle\subseteq\langle g^d\rangle$. To prove the other inclusion, since $d=\gcd(m,n)$, there is $x,y\in\mathbb{Z}$ such that d=mx+ny. Then

$$g^d = g^{mx+ny} = (g^m)^x (g^n)^y = (g^m)^x 1^y = (g^m)^x \in \langle g^m \rangle$$

Thus $\langle g^d \rangle \subseteq \langle g^m \rangle = H$. It follows that $H = \langle g^d \rangle$. Note that since $d = \gcd(m, n)$, we have $d \mid n$. By proposition, we have

$$|H| = o\big(g^d\big) = \frac{n}{\gcd(n,d)} = \frac{n}{d}$$

Thus $|H| \mid |G|$ **Proof of 2:** By proposition, the cyclic subgroup $\langle g^{\frac{n}{k}} \rangle$ is of order

$$\frac{n}{\gcd(n,\frac{n}{k})} = \frac{n}{n/k} = k$$

To show uniqueness, let K be a subgroup of G with order $k \mid n$. By 1, let $K = \langle g^d \rangle$ where $d \mid n$. Then by props, we have,

$$k = |K| = o(g^d) = \frac{n}{\gcd(n, d)} = \frac{n}{d}$$

Cyclic Groups 18

It follows that $d = \frac{n}{k}$ and thus $K = \langle g^{\frac{n}{k}} \rangle$

2.5 Non-cyclic Groups

Definition 2.5.1

Let X be a non-empty subset of a group G, and let

$$\langle X \rangle \coloneqq \left\{ x_1^{k_1} \cdots x_m^{k_m} \ \middle| \ x_i \in X, k_i \in \mathbb{Z}, m \geq 1 \right\}$$

denote the set of all products of powers of (not necessarily distinct) elements of X. Note that this is clearly a group. $\langle X \rangle$ is called the *subgroup of G generated by X*.

Example 2.5.1

The Klein-4 group $K_4 = \{1, a, b, c\}$ with $a^2 = b^2 = c^2 = 1$ and ab = c. Thus

$$K_4 = \langle a, b \mid a^2 = 1 = b^2 \text{ and } ab = ba \rangle$$

Example 2.5.2

The symmetric group of order 3 $S_3=\left\{\varepsilon,\sigma,\sigma^2,\tau,\tau\sigma,\tau\sigma^2\right\}$ where $\sigma^3=\varepsilon=\tau^2$ and $\sigma\tau=\tau\sigma^2$ (one can take $\tau=(12)$ and $\sigma=(123)$) Thus

$$\langle \sigma, \tau \mid \sigma^3 = \varepsilon = \tau^2 \text{ and } \sigma\tau = \tau\sigma^2 \rangle$$

We can also replace σ, τ with $\sigma, \tau \sigma$ or $\sigma, \tau \sigma^2, ...,$ etc

Definition 2.5.2

For $n \geq 2$ the dihedral group of order 2n is defined by

$$D_{2n} = \{1, a, ..., a^{n-1}, b, ba, ..., ba^{n-1}\}$$

Where $a^n = 1 = b^2$ and aba = b. Thus

$$D_{2n} = \langle a, b \mid a^n = 1 = b^2 \text{ and } aba = b \rangle$$

Note

For n = 2 or 3 we have

$$D_4\cong K_4\quad \text{and}\quad D_6\cong S_3$$

Exercise 2.5.1

For $n \geq 3$, consider a regular n-gon and its group of symmetries. How does it relate to D_{2n} ?

Non-cyclic Groups 19

3 Normal Subgroups

3.1 Homomorphisms and Isomorphisms

Definition 3.1.1

Let G, H be groups. A mapping $\alpha: G \to H$ is a homomorphism if

$$\alpha(a *_G b) = \alpha(a) *_H \alpha(b) \quad \forall a, b \in G$$

To simplify notation, we often write

$$\alpha(ab) = \alpha(a)\alpha(b) \quad \forall a, b \in G$$

Example 3.1.1

Consider the determinant map

$$\det: \operatorname{GL}_n(\mathbb{R}) \longrightarrow \mathbb{R}^*$$
$$A \longmapsto \det A$$

Since $\det AB = \det A \det B$, the mapping \det is a homomorphism.

Proposition 3.1

Let $\alpha: g \to H$ be a group homomorphism. Then

- 1. $\alpha(1_G) = 1_H$
- 2. $\alpha(g^{-1}) = \alpha(g)^{-1} \quad \forall g \in G$
- 3. $\alpha(g^k) = \alpha(g)^k \quad \forall k \in \mathbb{Z}$

Definition 3.1.2

Let $\alpha: G \to H$ be a mapping between groups. If α is a homomorphism and α is bijective, we say α is an *isomorphism*. In this case, we say G, H are *isomorphic* and write $G \cong H$.

Proposition 3.2

We have

- 1. The identity map $id: G \to G$ is an isomorphism.
- 2. If $\sigma:G\to H$ is an isomorphism, then the inverse map $\sigma^{-1}:h\to G$ is also an isomorphism.
- 3. If $\sigma:G\to H$ and $\tau:H\to K$ is an isomorphism, the composite map $\tau\sigma:G\to K$ is also an isomorphism.

So \cong is (sort-of) an equivalence relation

Proof: Exercise.

Example 3.1.2

Let $\mathbb{R}^+ = \{r \in \mathbb{R} \mid r > 0\}$. Then $(\mathbb{R}, +) \cong (\mathbb{R}^+, \cdot)$ since we see that

$$\sigma: \mathbb{R} \to \mathbb{R}^+$$
$$x \longmapsto e^x$$

is a bijection. Moreover, $\sigma(x+y)=e^{x+y}=e^x\cdot e^y=\sigma(x)\sigma(y)$ thus σ is an isomorphism.

Example 3.1.3

<u>Claim:</u> $(\mathbb{Q}, +) \ncong (\mathbb{Q}^*, \cdot)$ Suppose $\tau : (\mathbb{Q}, +) \to (\mathbb{Q}^*, \cdot)$ is an isomorphism. Thus τ is surjective. So there is some $q \in \mathbb{Q}$ such that $\tau(q) = 2$. Then

$$\tau \left(\frac{q}{2}\right)^2 = \tau \left(\frac{q}{2}\right) \tau \left(\frac{q}{2}\right) = \tau \left(\frac{q}{2} + \frac{q}{2}\right) = \tau(q) = 2$$

Thus $\tau(\frac{q}{2})$ is a rational number whose square is 2, a contradiction.

3.2 Cosets and Lagrange's Theorem

Definition 3.2.1

Let H be a subgroup of a group G. If $a \in G$, we define

$$Ha = \{ha \mid h \in H\}$$

to be the *right coset of H generated by a*. We define the left coset similarly.

Remark

Since $1 \in H$, we have H1 = H = 1H. Also $a \in Ha$ and $a \in aH$. Note that in general Ha and aH are not subgroups of G, and $aH \neq Ha$. However, if G is abelian, then Ha = aH.

Example 3.2.1

Let $K_4 = \{1, a, b, ab\}$. Let $H = \{1, a\}$ which is a subgroup of K_4 . Note that since K_4 is abelian, we have gH = Hg for all $g \in K_4$. Then the (right or left) cosets of H are

$$H1=\{1,a\}=1H$$

and

$$Hb = \{b, ab\} = Hab$$

Thus there are exactly two cosets of H in K_4

Example 3.2.2

Let $S_3=\left\{ arepsilon,\sigma,\sigma^2,\tau,\tau\sigma,\tau\sigma^2 \right\}$ with $\sigma^3=arepsilon=\tau^2$ and $\sigma\tau\sigma=\tau$. Let $H=\left\{ arepsilon,\tau \right\}$ which is a subgroup of S_3 . Since $\sigma\tau=\tau\sigma^{-1}=\tau\sigma^2$, the right cosets of H are

$$\begin{split} H\varepsilon &= \{\varepsilon,\tau\} &= H\tau \\ H\sigma &= \{\sigma,\tau\sigma\} &= H\tau\sigma \\ H\sigma^2 &= \left\{\sigma^2,\tau\sigma^2\right\} &= H\tau\sigma^2 \end{split}$$

And the left cosets of H are

$$\varepsilon H = \{\varepsilon, \tau\} = \tau H$$
$$\sigma H = \{\sigma, \tau \sigma^2\} = \tau \sigma^2 H$$
$$\sigma^2 H = \{\sigma^2, \tau \sigma\} = \tau \sigma H$$

Notice that $H\sigma \neq \sigma H$ and $H\sigma^2 \neq \sigma^2 H$

Proposition 3.3

Let H be a subgroup of a group G and let $a, b \in G$.

- 1. Ha = Hb if and only if $ab^{-1} \in H$. In particular, we have Ha = H if and only if $a \in H$.
- 2. If $a \in Hb$, then Ha = Hb
- 3. Either Ha = Hb or $Ha \cap Hb = \emptyset$. Thus, the distinct right cosets of H forms a partition of G.

Proof of 1:

 (\Longrightarrow) If Ha=Hb, then $a=1a\in Ha=Hb$. Thus a=hb for some $h\in H$ and we have $ab^{-1}=h\in H$. (\Longleftrightarrow) Suppose $ab^{-1}\in H$ for all $h\in H$. Then for all $h\in H$,

$$ha = hab^{-1}b = h(ab^{-1})b \in Hb$$

Thus $Ha \subseteq Hb$. Note that if $ab^{-1} \in H$, since H is a subgroup, then

$$(ab^{-1})^{-1} = ba^{-1} \in H$$

Thus for all $h \in H$,

$$hb=h\big(ba^{-1}\big)a\in Ha$$

Thus $Hb \subseteq Ha$. It follows that Ha = Hb.

Proof of 2: If $a \in Hb$, then $ab^{-1} \in H$. Thus, by (1), we have Ha = Hb.

Proof of 3: Two cases:

- 1. If $Ha \cap Hb = \emptyset$, then we are done.
- 2. If $Ha \cap Hb \neq \emptyset$, then there exists $x \in Ha \cap Hb$. Since $x \in Hb$, by (2), we have Hb = Hx. Thus

$$Ha = Hx = Hb$$

Remark

The analogues of the previous proposition also holds for left cosets

1. aH = bH if and only if $b^{-1}a \in H$

Exercise 3.2.1

Let G be a group and H a subset of G. For $a, b \in G$, do we still have Ha = Hb, or $Ha \cap Hb = \emptyset$ if H is not a subgroup of G.

Definition 3.2.2

By the previous proposition, we see that G can be written as a disjoint union of right cosets of H. We define the index [G:H] to be the number of disjoint right (or left) cosets of H in G. (Note that [G:H] could be infinite).

Theorem 3.4 Lagrange's Theorem

Let H be a subgroup of a finite group G. We have $|H| \mid |G|$ and

$$[G:H] = \frac{|G|}{|H|}$$

Proof: Write k = [G:H] and let $Ha_1, ..., Ha_k$ be the distinct right cosets of H in G. By prop

$$G = Ha_1 \sqcup \cdots \sqcup Ha_k$$

is a disjoint union. Since $|Ha_i| = |H|$ for each i, we have

$$|G| = |Ha_1| + \dots + |Ha_k| = k|H|$$

It follows that $|H| \mid |G|$ and $[G:H] = k = \frac{|G|}{|H|}$.

Corollary 3.5

- 1. If G is a finite group and $g \in G$ then $o(g) \mid |G|$
- 2. If G is a finite group with |G|=n, then for all $g\in G$, we have $g^n=1$

Proof of 1: Take $H = \langle g \rangle$ in the theorem. Note that |H| = o(g) **Proof of 2:** Let o(g) = m then by (1), we have $m \mid n$. Thus

$$g^n = (g^m)^{\frac{n}{m}} = 1^{\frac{n}{m}} = 1$$

Example 3.2.3

For $n \in \mathbb{N}$ with $n \geq 2$, let \mathbb{Z}_n^* be the set of (multiplicative) invertible elements in \mathbb{Z}_n . Let the Euler's φ -function $\varphi(n)$, denote the order of \mathbb{Z}_n^* . i.e.

$$\varphi(n) = |\{[k] \in \mathbb{Z}_n \mid k \in \{0, 1, ..., n-1\} \text{ and } \gcd(k, n) = 1\}|$$

As a direct consequence of the corollary, we see that if $a \in \mathbb{Z}$ with $\gcd(a,n) = 1$, then $a^{\varphi(n)} \equiv 1 \pmod{n}$. This is Euler's Theorem. If n = p, a prime number, then Euler's Theorem implies that $a^{p-1} \equiv 1 \pmod{p}$, which is Fermat's little theorem.

Recall

If |G|=2 then $G\cong C_2$, and |G|=3 then $G\cong C_3$.

Corollary 3.6

If G is a group with |G| = p a prime, then $G \cong C_p$, the cyclic group of order p.

Proof: Let $g \in G$ with $g \neq 1$. Then by corollary, we have $o(g) \mid p$. Since $g \neq 1$ and p is a prime, we have o(g) = p. By proposition, we have

$$|\langle g \rangle| = o(g) = p$$

It follows that $G \cong \langle g \rangle \cong C_p$

Corollary 3.7

Let *H* and *K* be finite subgroups of a group *G*. If gcd(|H|, |K|) = 1, then $H \cap K = \{1\}$.

Proof: Note $H \cap K$ is a subgroup of H and K. So by Lagrange's Theorem, we have $|H \cap K| \mid |H|$ and $|H \cap K| \mid |K|$. It follows that $|H \cap K| \mid |\gcd(|H|, |K|)$, i.e. $|H \cap K| = 1$ Thus $H \cap K = \{1\}$.

3.3 Normal Subgroups

Definition 3.3.1

Let H be a subgroup of a group G. If gH = Hg for all $g \in G$, we say H is *normal*, denoted by $H \triangleleft G$.

Example 3.3.1

We have $\{1\} \triangleleft G$ and $G \triangleleft G$.

Example 3.3.2

The center Z(G) of G is an abelian subgroup of G. By its definition, $Z(G) \triangleleft G$. Thus every subgroup of Z(G) is normal in G.

Normal Subgroups 24

Example 3.3.3

If G is an abelian group, then every subgroup of G is normal in G. Note the converse is false (see assignment 3)

Proposition 3.8 Normality Test

Let H be a subgroup of a group G. The following are equivalent:

- 1. $H \triangleleft G$
- 2. $gHg^{-1} \subseteq H$ for all $g \in G$. We call gHg^{-1} a conjugate of H
- 3. $gHg^{-1} = H$ for all $g \in G$. (Thus $H \triangleleft G$ if and only if H is the only conjugate of H)

 $\begin{array}{l} \textit{Proof of } (1) \Longrightarrow (2) \text{: Let } ghg^{-1} \in gHg^{-1} \text{ for some } h \in H. \text{ Then by (1), } gh \in gH = Hg, \text{ say } gh = h_1g \\ \text{for some } h_1 \in H. \text{ Then } ghg^{-1} = h_1gg^{-1} = h_1 \in H. \\ \textbf{Proof of } (2) \Longrightarrow (3) \text{: If } g \in G, \text{ then by (2), } gHg^{-1} \subseteq H. \text{ Taking } g^{-1} \text{ in place of } g \text{ in (2), we get} \\ g^{-1}Hg \subseteq H. \text{ Thus implies that } H \subseteq gHg^{-1} \text{ Thus } H = gHg^{-1}. \\ \textbf{Proof of (3)} \Longrightarrow (1) \text{: If } gHg^{-1} = H, \text{ then } gH = Hg. \\ \end{array}$

Example 3.3.4

Let $G=\mathrm{GL}_n(\mathbb{R})$ and $H=\mathrm{SL}_n(\mathbb{R})$. For $A\in G$ and $B\in H$, we have $\det(ABA^{-1})=\det A\det B\det A^{-1}=\det B=1$

Thus $ABA^{-1} \in H$ and it follows that $AHA^{-1} \subseteq H$ for all $A \in G$, so by the normality test, $\mathrm{SL}_n(\mathbb{R}) \lhd \mathrm{GL}_n(\mathbb{R})$.

Proposition 3.9

If H is a subgroup of a group G with [G:H]=2, then $H \lhd G$.

Proof: Let $g \in G$, If $g \in H$, then Hg = H = gH. If $g \notin H$, since [G : H] = 2, then $G = H \sqcup Hg$, a disjoint union. Then $Hg = G \setminus H$. Similarly, $gH = G \setminus H$. Thus gH = Hg for all $g \in G$ i.e. $H \lhd G$. \square

Example 3.3.5

Let A_n be the alternating group contained in S_n . Since $[S_n:A_n]=2$. By proposition, we have $A_n\lhd S_n$.

Example 3.3.6

Let $D_{2n}=\langle a,b \mid a^n=1=b^2 \text{ and } aba=b \rangle$ be the dihedral group of order 2n. Since $[D_{2n}:\langle a \rangle]=2$, by proposition, $\langle a \rangle \lhd D_{2n}$

Let H and K be subgroups of a group G. Then the intersection $H \cap K$ is the largest subgroup of G that contained in both H and K.

Question: What is the smallest subgroup containing H and K? Note that $H \cup K$ is the smallest subset

Normal Subgroups 25

containing H and K, but $H \cup K$ is a subgroup if and only if $H \subseteq K$ or $H \supseteq K$. A more useful subset to consider is the *product* HK of H and K defined as follows

Definition 3.3.2

 $HK = \{hk \mid h \in H, k \in K\}$

Remark

The product of 2 subgroups is not always a subgroup.

Lemma 3.10

Let H and K be subgroups of a group G, then the following are equivalent:

- 1. HK is a subgroup of G
- 2. HK = KH
- 3. KH is a subgroup of G.

Proof of $(1 \Leftrightarrow 2)$: Note that $(2 \Leftrightarrow 3)$ will follow after exchanging H and K. Suppose (2) holds, we have $1 = 1 \cdot 1 \in HK$. Also if $hk \in HK$, then $(hk)^{-1} = k^{-1}h^{-1} \in KH = HK$. Also for $hk, h_1, k_1 \in HK$, we have $kh_1 \in KH = HK$, say $kh_1 = h_2k_2$, it follows that

$$(hk)(h_1k_1)=h(kh_1)k_1=h(h_2k_2)k_1=(hh_2)(k_2k_1)\in HK$$

By the subgroup test, HK is a subgroup of G. Suppose conversely that (1) holds. Let $kh \in KH$ with $k \in K$, $h \in H$. Since H and K are subgroups of G, we have $h^{-1} \in H$, and $k^{-1} \in K$. Since HK is a subgroup of G, we have

$$kh = (h^{-1}k^{-1})^{-1} \in HK$$

Thus $KH \subseteq HK$, similarly, one can show $HK \subseteq KH$. Thus HK = KH.

Proposition 3.11

Let H and K be subgroups of a group G. Then

- 1. If $H \triangleleft G$ or $K \triangleleft G$, then HK = KH is a subgroup of G
- 2. If $H \triangleleft G$ and $K \triangleleft G$, then $KH \triangleleft G$

Proof of 1: Suppose $H \triangleleft G$ then

$$HK = \bigcup_{k \in K} Hk = \bigcup_{k \in K} kH = KH$$

By lemma, HK = KH is a subgroup of G.

Proof of 2: If $g \in G$ and $hk \in HK$, since $H \triangleleft G$ and $K \triangleleft G$ we have

$$g^{-1}(hk)g=\big(g^{-1}hg\big)\big(g^{-1}kg\big)\in HK$$

Thus $g^{-1}HKg \subseteq HK$ and $HK \triangleleft G$.

Normal Subgroups 26

Definition 3.3.3

Let H be a subgroup of a group G. The normalizer of H, denoted by $N_G(H)$ is defined to be

$$N_G(H) = \{g \in G \,|\, gH = Hg\}$$

We see that $H \triangleleft G$ if and only if $N_G(H) = G$

Note

In the proof of the previous proposition, we do not need the full assumption that $H \triangleleft G$. We only need kH = Hk for all $k \in K$, i.e. $k \in N_G(H)$ Thus

Corollary 3.12

Let H and K be subgroups of a group G. If $K \subseteq N_G(H)$ (or $H \subseteq N_G(K)$) then HK = KH is a subgroup of G.

Theorem 3.13

If $H \triangleleft G$ and $K \triangleleft G$ satisfy $H \cap K = \{1\}$, then $HK \cong H \times K$.

Proof:

<u>Claim:</u> If $H \triangleleft G$ and $K \triangleleft G$ satisfy $H \cap K = \{1\}$ then hk = kh for all $h \in H$ and $k \in K$. Consider $x = hk(kh)^{-1} = hkh^{-1}k^{-1}$. Note that $kh^{-1}k^{-1} \in kHk^{-1} = H$ (since $H \triangleleft G$). Thus $x \in H$. Similarly, since $hkh^{-1} \in hKh^{-1} = K$, we have $x \in K$. Since $x \in H \cap K = \{1\}$, we have $hkh^{-1}k^{-1} = 1$ i.e. hk = kh.

Since $H \triangleleft G$, by proposition, HK is a subgroup of G. Define $\sigma: H \times K \to HK$ by $\sigma(h, k) = hk$. Claim: σ is an isomorphism.

Let $(h, k), (h_1, k_1) \in H \times K$ By claim 1, we have $h_1 k = k h_1$. Thus

$$\sigma((h,k) \cdot (h_1,k_1)) = \sigma(hh_1,kk_1) = hh_1kk_1 = hkh_1k_1 = \sigma(h,k) \cdot \sigma(h_1,k_1)$$

Thus σ is a homomorphism. Note that by the definition of HK, σ is surjective. Also, if $\sigma(h,k)=\sigma(h_1,k_1)$, we have $hk=h_1k_1$. Thus $h_1^{-1}h=k_1k^{-1}\in H\cap K=\{1\}$ Thus $h_1^{-1}h=1=k_1k^{-1}$ i.e. $h_1=h$ and $k_1=k$. Thus σ is injective. So σ is an isomorphism and we have $HK\cong H\times K$.

Corollary 3.14

Let G be a finite group, and let H and K be normal subgroups such that $H \cap K = \{1\}$ and |H||K| = |G|. Then $G \cong H \times K$.

Proof:

$$|HK| = \frac{|H||K|}{|H \cap K|} = |H||K| = |G|$$

Thus HK = G, and so a direct application of the theorem gives $G = HK \cong H \times K$.

Normal Subgroups 27

Example 3.3.7

Let $m,n\in\mathbb{N}$ with $\gcd(m,n)=1$. Let G be a cyclic group of order mn. Write $G=\langle a\rangle$ with o(a)=mn. Let $H=\langle a^n\rangle$ and $K=\langle a^m\rangle$. Thus $|H|=o(a^n)=m$ and $|K|=o(a^m)=n$. It follows that |H||K|=mn=|G|. Since $\gcd(m,n)=1$, by corollary, we have $H\cap K=\{1\}$. Also, since G is cyclic and thus abelian, we have $H\lhd G$ and $K\lhd G$. Then by corollary, we have $G\cong H\times K$, i.e. $C_{mn}\cong C_m\times C_n$. Hence, to consider finite cyclic groups, it suffices to consider cyclic groups of prime power order.

4 Isomorphism Theorems

4.1 Quotient Groups

Remark

Let K be a subgroup of G. Consider the set of right cosets of K, i.e. $\{Ka \mid a \in G\}$. To make it a group, a natural way is to define

$$Ka \cdot Kb = Kab \quad \forall a, b \in G \quad (*)$$

Note that we could have $Ka = Ka_1$ and $Kb = Kb_1$ with $a \neq a_1$ and $b \neq b_1$, Thus in order for (*) to make sense, a necessary condition is

$$Ka = Ka_1$$
 and $Kb = Kb_1 \Longrightarrow Kab = Ka_1b_1$

In this case, we say that the multiplication is well-defined.

Lemma 4.1

Let K be a subgroup of a group G, the following are equivalent:

- 1. $K \triangleleft G$
- 2. For $a, b \in G$, the multiplication $Ka \cdot Kb = Kab$ is well-defined.

Proof of $(1\Rightarrow 2)$: Let $Ka=Ka_1$ and $Kb=Kb_1$. Thus $aa_1^{-1}\in K$ and $bb_1^{-1}\in K$. To get $Kab=Ka_1b_1$, we need $ab(a_1b_1)^{-1}\in K$. Note that since $K\lhd G$, we have $aKa^{-1}=K$. Thus

$$ab(a_1b_1)^{-1}=abb_1^{-1}a_1^{-1}=\big(abb_1^{-1}a^{-1}\big)\big(aa_1^{-1}\big)\in K$$

Thus $Kab = Ka_1b_1$.

Proof of $(2 \Rightarrow 1)$: If $a \in G$, to show $K \triangleleft G$, we need $aka^{-1} \in K$ for all $k \in K$. Since Ka = Ka and Kk = K1, by (2), we have Kak = Ka1 i.e. Kak = Ka. It follows that $aka^{-1} \in K$. Thus $K \triangleleft G$.

Proposition 4.2

Let $K \triangleleft G$ and write $G/K = \{Ka \mid a \in G\}$ for the set of all cosets of K. Then

- 1. G/K is a group under the operation Ka * Kb = Kab.
- 2. The mapping $\varphi: G \to G/K$ given by $\varphi(a) = Ka$ is a surjective homomorphism.
- 3. If [G:K] is finite, then |G/K| = [G:K]. In particular, if |G| is finite, then $|G/K| = \frac{|G|}{|K|}$

Quotient Groups 28

Proof of 1: By other proposition, the operation is well defined and G/K is closed under operation. The identity of G/K is $K \cdot 1 = K$. Also, the inverse of Ka is Ka^{-1} . Finally, by the associativity of G, we have

$$Ka(KbKc) = (KaKb)Kc.$$

It follows that G/K is a group.

Proof of 2: φ is clearly surjective. Also, for $a, b \in G$, we have

$$\varphi(a)\varphi(b) = KaKb = Kab = \varphi(ab)$$

so φ is a homomorphism.

Proof of 3: If [G:K] is finite, by the definition of index, |G/K| = [G:K]. Also, if |G| is finite, by Lagrange's Theorem, $|G/K| = [G:K] = \frac{|G|}{|K|}$

Definition 4.1.1

Let $K \triangleleft G$. The group G/K of all cosets of K in G is called the *quotient group of* G *by* K. Also, the mapping $\varphi: G \rightarrow G/K$ given by $\varphi(a) = Ka$ is called the *coset map*.

Exercise 4.1.1

List all normal subgroups of D_{10} and all quotient groups of D_{10}/K .

4.2 Isomorphism Theorems

Definition 4.2.1

Let $\alpha:G\to H$ be a group homomorphism. The *kernel of* α is defined by

$$\ker \alpha = \{g \in G \mid \alpha(g) = 1_H\} \subseteq G$$

and the *image* of α is defined by

$$\operatorname{im} \alpha = \alpha(G) = \{\alpha(g) \mid g \in G\} \subseteq H$$

Proposition 4.3

Let $\alpha: G \to H$ be a group homomorphism

- 1. $\operatorname{im} \alpha$ is a subgroup of H
- 2. $\ker \alpha$ is a normal subgroup of G

Proof of 1: Note that $1_H = \alpha(1_G) \in \operatorname{im} \alpha$. Also, for $h_1 = \alpha(g_1), h_2 = \alpha(g_2) \in \operatorname{im} \alpha$, we have

$$h_1h_2 = \alpha(g_1)\alpha(g_2) = \alpha(g_1g_2) \in \operatorname{im} \alpha$$

Also, by proposition, $\alpha(g)^{-1} = \alpha(g^{-1}) \in \operatorname{im} \alpha$. By the subgroup test, $\operatorname{im} \alpha$ is a subgroup of H. \square **Proof of 2:** For $\ker \alpha$, note that $\alpha(1_G) = 1_H$. Also, for $k_1, k_2 \in \ker \alpha$, then

$$\alpha(k_1 k_2) = \alpha(k_1)\alpha(k_2) = 1 \cdot 1 = 1$$

and

$$\alpha(k_1^{-1}) = \alpha(k_1)^{-1} = 1^{-1} = 1$$

By the subgroup test, $\ker \alpha$ is a subgroup of G. Note that if $g \in H$ and $k \in \ker \alpha$, then

$$\alpha(gkg^{-1})=\alpha(g)\alpha(k)\alpha(g^{-1})=\alpha(g)1\alpha(g)^{-1}=1$$

Thus $g(\ker \alpha)g^{-1} \subseteq \ker \alpha$. By the normality test, $\ker \alpha \triangleleft G$.

Example 4.2.1

Consider the determinant map $\det: \mathrm{GL}_n(\mathbb{R}) \to \mathbb{R}^*$ defined by $A \mapsto \det A$. Then $\ker(\det) = \mathrm{SL}_n(\mathbb{R})$. Thus, we get another proof that $\mathrm{SL}_n(\mathbb{R}) \lhd \mathrm{GL}_n(\mathbb{R})$.

Example 4.2.2

Define the sign of a permutation $\sigma \in S_n$ by

$$\operatorname{sgn}(\sigma) = \begin{cases} 1 & \text{if } \sigma \text{ is even} \\ -1 & \text{if } \sigma \text{ is odd} \end{cases}$$

Note that ${\rm sgn}: S_n \to (\pm 1, \cdot)$ defined by $\sigma \mapsto {\rm sgn}(\sigma)$ is a homomorphism. Also, ${\rm ker}({\rm sgn}) = A_n$. Thus we have another proof that $A_n \lhd S_n$.

Theorem 4.4

First Isomorphism Theorem

Let $\alpha:G\to H$ be a group homomorphism. Then

$$G/\ker\alpha\cong\operatorname{im}\alpha$$

Proof: Let $K = \ker \alpha$. Since $K \triangleleft G$, G/K is a group. Define the map

$$\overline{\alpha}: G/K \longrightarrow \operatorname{im} \alpha$$
 $Kg \longmapsto \alpha(g)$

Note that

$$Kg=Kg_1 \Longleftrightarrow gg_1^{-1} \in K \Longleftrightarrow \alpha\big(gg_1^{-1}\big)=1 \Longleftrightarrow \alpha(g)=\alpha(g_1)$$

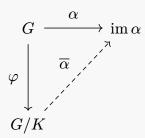

Thus, $\overline{\alpha}$ is well-defined and injective. Also $\overline{\alpha}$ is clearly surjective. For $g, h \in G$, we have

$$\overline{\alpha}(KgKh) = \overline{\alpha}(Kgh) = \alpha(gh) = \alpha(g)\alpha(h) = \overline{\alpha}(Kg)\overline{\alpha}(Kh)$$

Thus $\overline{\alpha}$ is a group isomorphism and we have $G/\ker \alpha \cong \operatorname{im} \alpha$.

Remark

Let $\alpha: G \to H$ be a group homomorphism and $K = \ker \alpha$. Let $\varphi: G \to G/K$ be the coset map and let $\overline{\alpha}$ be defined as in the previous proof. We have the following diagram:

Note that for $g \in G$, we have

$$\overline{\alpha}\varphi(g) = \overline{\alpha}(\varphi(g)) = \overline{\alpha}(Kg) = \alpha(g)$$

Thus $\alpha = \overline{\alpha}\varphi$ on the other hand, if we have $\alpha = \overline{\alpha}\varphi$, then the action of $\overline{\alpha}$ is determined by α and φ as

$$\overline{\alpha}(Kg) = \overline{\alpha}(\varphi(g)) = \overline{\alpha}\varphi(g) = \alpha(g)$$

Thus $\overline{\alpha}$ is the only homomorphism $G/K \to H$ satisfying $\overline{\alpha}\varphi = \alpha$.

Proposition 4.5

Let $\alpha: G \to H$ be group homomorphism and $K = \ker \alpha$. Then α factors uniquely as $\alpha = \overline{\alpha}\varphi$ where $\varphi: g \to G/K$ is the coset map and $\overline{\alpha}: G/K \to H$ is defined by $\overline{\alpha}(Kg) = \alpha(g)$. Note that φ is surjective and $\overline{\alpha}$ is injective.

Example 4.2.3

We have seen that $(\mathbb{Z}, +) = \langle \pm 1 \rangle$ and for $n \in \mathbb{N}$, $(\mathbb{Z}_n, +) = \langle [1] \rangle$ are cyclic groups. In the following, we will show that these are the only cyclic groups.

Let $G=\langle g\rangle$ be a cyclic group. Consider $\alpha:(\mathbb{Z},+)\to G$ defined by $\alpha(k)=g^k$ for all $k\in\mathbb{Z}$, which is a group homomorphism. By the definition of $\langle g\rangle$, α is surjective. Note that $\ker\alpha=\{k\in\mathbb{Z}\mid g^k=1\}$, we have two cases:

1. If $o(g) = \infty$, then $\ker \alpha = \{0\}$. By the first isomorphism theorem, we have

$$G\cong \mathbb{Z}/\{0\}\cong \mathbb{Z}$$

2. If o(g) = n, by proposition, $\ker \alpha = n\mathbb{Z}$. By the first isomorphism theorem,

$$G\cong \mathbb{Z}/n\mathbb{Z}\cong \mathbb{Z}_n$$

By (1) and (2), we can conclude that if G is cyclic, then $G\cong \mathbb{Z}$ or $G\cong \mathbb{Z}_n$.

Theorem 4.6

Second Isomorphism Theorem

Let H and K be subgroups of a group G with $K \triangleleft G$. Then HK is a subgroup of G, $K \triangleleft HK$, $H \cap K \triangleleft H$ and $HK/K \cong H/H \cap K$.

Proof: Since $K \lhd G$, by proposition, HK is a subgroup, HK = KH and $K \lhd HK$. Consider $\alpha: H \to HK/K$ defined by $\alpha(h) = Kh$. (note that $h \in H \subseteq HK$). Then α is a homomorphism (exercise). Also, if $x \in HK = KH$, say x = kh, then

$$Kx = K(kh) = Kh = \alpha(h)$$

Thus α is surjective. Finally, by proposition,

$$\ker \alpha = \{ h \in H \mid Kh = K \} = \{ h \in H \mid h \in K \} = H \cap K$$

By the first isomorphism theorem,

$$H/H \cap K \cong HK/K$$

Theorem 4.7

Third Isomorphism Theorem

Let $K \subseteq H \subseteq G$ be groups with $K \lhd G$ and $H \lhd G$. Then $H/K \lhd G/K$ and

$$(G/K)/(H/K) \cong G/H$$

Proof: Define $\alpha: G/K \to G/H$ by $\alpha(Kg) = Hg$ for all $g \in G$. Note that if $Kg = Kg_1$, then $gg_1^{-1} \in K \subseteq H$. Thus $Hg = Hg_1$ and α is well defined. Clearly, α is surjective. Note that

$$\ker \alpha = \{Kg \, | \, Hg = H\} = \{Kg \, | \, g \in H\} = H/K$$

By the first isomorphism theorem,

$$(G/K)/(H/K) \cong G/H$$

5 Group Actions

5.1 Cayley's Theorem

Theorem 5.1

Cayley's Theorem

If G is a finite group of order n, then G is isomorphic to a subgroup of S_n .

Proof: Let $G=\langle g_1,...,g_n\rangle$ and let S_G be the permutation group of G. By identifying g_i with i, we see that $S_G\cong S_n$. Thus it suffices to find a injective homomorphism $\sigma:G\to S_G$. For $a\in G$, define $\mu_a:G\to G$ by $\mu_a(g)=ag$ for all $g\in G$. Note that $ag=ag_1$ implies $g=g_1$ and $a(a^{-1}g)=g$. Hence μ_a is a bijection and $\mu_a\in S_G$. Define $\sigma:G\to S_G$ by $\sigma(a)=\mu_a$. For $a,b\in G$, we have $\mu_a\mu_b=\mu_{ab}$ and σ is a homomorphism. Also, if $\mu_a=\mu_b$, then $a=\mu_a(1)=\mu_b(1)=b$. Thus, by the first isomorphism theorem, we have $G\cong \operatorname{im} \sigma$, a subgroup of $S_G\cong S_n$.

Cayley's Theorem 32

Example 5.1.1

Let H be a subgroup of a group G with $[G:H]=m<\infty$. Let $X=\{g_1H,g_2H,...,g_mH\}$ be the set of all distinct left cosets of H in G. For $a\in G$, define $\lambda_a:X\to X$ by $\lambda_a(gH)=agH$ for all $gH\in X$. Note that $agH=ag_1H$ implies that $gH=g_1H$ and $a(a^{-1}gH)=gH$. Hence λ_a is a bijection and thus $\lambda_a\in S_X$. Consider $\tau:G\to S_X$ defined by $\tau(a)=\lambda_a$. For $a,b\in G$, we have $\lambda_{ab}=\lambda_a\lambda_b$ and thus τ is a homomorphism. Note that if $a\in\ker\tau$, then λ_a is the identity permutation. In particular, $aH=\lambda_a(H)=H$. In particular, $a\in H$. Thus $\ker\tau\subseteq H$.

Theorem 5.2

Extended Cayley's Theorem

Let H be a subgroup of a group G with $[G:H]=m<\infty$. If G has no normal subgroup contained in H except for $\{1\}$, then G is isomorphic to a subgroup of S_m .

Proof: Let X be the set of all distinct left cosets of H in G. We have |X|=m and $S_X\cong S_m$. We have seen from the above example that there exist a group homomorphism $\tau:G\to S_X$ with $K=\ker\tau\subseteq H$. By the first isomorphism theorem, we have $G/K\cong\operatorname{im}\tau$. Since $K\subseteq H$ and $K\lhd G$, by the assumption, we have $K=\{1\}$. It follows that $G\cong\operatorname{im}\tau$, a subgroup of $S_X\cong S_m$.

Corollary 5.3

Let G be a finite group and p the smallest prime dividing |G|. If H is a subgroup of G with [G:H]=p then $H \lhd G$.

Proof: Let X be the set of all distinct left cosets of H in G. We have |X|=p and $S_X\cong S_p$. Let $\tau:G\to S_X\cong S_p$ be the group homomorphism defined in the above example with $K:=\ker\tau\subseteq H$. By the first isomorphism theorem, we have $G/K\cong\operatorname{im}\tau\subseteq S_p$. Thus G/K is isomorphic to a subgroup of S_p . By Lagrange's Theorem, we have $|G/K|\mid p!$. Also, since $K\subseteq H$, if [H:K]=k, then

$$|G/K| = \frac{|G|}{|K|} = \frac{|G|}{|H|} \frac{|H|}{|K|} = pk.$$

Thus $pk \mid p!$ and hence $k \mid (p-1)!$. Since $k \mid |H|$, which divides |G| and p is the smallest prime dividing |G|, we see every prime divisor of k must be $\geq p$ unless k=1. Combining this with $k \mid (p-1)!$, this forces k=1, which implies K=H, thus K=H.

5.2 Group Actions

Definition 5.2.1

Let G be a group and X a non-empty set. A (left) group action of G on X is a mapping $G \times X \to X$ denoted $(a,x) \mapsto a \cdot x$ such that

- 1. $1 \cdot x = x$ for all $x \in X$
- 2. $a \cdot (b \cdot x) = (ab) \cdot x$ for all $a, b \in G$ and $x \in X$

In this case, we say G acts on X.

Group Actions 33

Remark

Let G be a group acting on a set $X \neq \emptyset$. For $a, b \in G$ and $x, y \in X$, by (1) and (2), we have

$$a\cdot x = b\cdot y \Longleftrightarrow (b^{-1}a)\cdot x = y$$

In particular, we have $a \cdot x = a \cdot y$ if and only if x = y.

Example 5.2.1

If G is group, let G act on itself by conjugation. i.e. X = G, by $a \cdot x = axa^{-1}$ for all $a, x \in G$. Note that

$$1 \cdot x = 1x1^{-1} = x$$

and

$$a \cdot (b \cdot x) = a(bxb^{-1})a^{-1} = (ab)x(ab)^{-1} = (ab) \cdot x$$

So it is indeed a group action.

Remark

For $a \in G$, define $\sigma_a : X \to X$ by $\sigma_a(x) = a \cdot x$ for all $x \in X$. Then one can show

- 1. $\sigma_a \in S_X$, the permutation group of X
- 2. The function $\theta:G\to S_X$ give $\theta(a)=\sigma_a$ is a group homomorphism with $\ker\theta=\{a\in G\,|\,ax=x\;\forall x\in X\}$

Note that the group homomorphism $\theta:G\to S_X$ gives an equivalent definition of group action of G on X. If X=G with |G|=n and $\ker\theta=\{1\}$, the map $\theta:G\to S_n$ shows that G is isomorphic to a subgroup of S_n , which is Cayley's Theorem. Thus, the notion of group action can be viewed as a generalization of the proof of Cayley's Theorem.

Definition 5.2.2

Let G be a group acting on $X \neq \emptyset$. Let $x \in X$. We call

- 1. $G \cdot x = \{g \cdot x \mid g \in G\} \subseteq X$ The orbit of x
- 2. $S(x) = \{g \in G \mid g \cdot x = x\} \subseteq G$ The stabilizer of x

Proposition 5.4

Let G be a group acting on a set $X \neq \emptyset$ and let $x \in X$. Then

- 1. S(x) is a subgroup of G.
- 2. There exists a bijection from $G \cdot x$ to $\{gS(x) \mid g \in G\}$ and thus $|G \cdot x| = [G : S(x)]$

Proof of 1: Since $1 \cdot x = x$, we have $1 \in S(x)$. Also, if $g, h \in S(x)$, then

$$gh \cdot (x) = g \cdot (h \cdot x) = g \cdot x = x$$

and

Group Actions 34

$$g^{-1} \cdot x = g^{-1} \cdot (g \cdot x) = (g^{-1}g) \cdot x = 1 \cdot x = x$$

Thus $gh, g^{-1} \in S(x)$. By the subgroup test, S(x) is a subgroup of G.

Proof of 2: Consider the map $\varphi: G \to \{gS(x) \mid g \in G\}$ defined by $\varphi(g \cdot x) = gS(x)$. Note that

$$g \cdot x = h \cdot x \Longleftrightarrow (h^{-1}g) \cdot x = x \Longleftrightarrow h^{-1}g \in S(x) \Longleftrightarrow hS(x) = gS(x)$$

Thus φ is well-defined and injective. Since φ is clearly surjective, φ is a bijection. It follows that

$$|G \cdot x| = |\{gS(x) \mid g \in G\}| = [G : S(x)]$$

Theorem 5.5

Orbit Decomposition Theorem

Let G be a group acting on a finite set $X \neq \emptyset$. Let

$$X_f = \{ x \in X \, | \, a \cdot x = x \, \, \forall a \in G \}$$

(Note that $x\in X_f$ iff $|G\cdot x|=1$) Let $G\cdot x_1,G\cdot x_2,...,G\cdot x_n$ denote the distinct non-singleton orbits (i.e. $|G\cdot x_i|>1$) Then

$$|X| = \left|X_f\right| + \sum_{i=1}^n [G:S(x_i)]$$

Proof: Note that for $a, b \in G$ and $x, y \in X$,

$$a\cdot x=b\cdot y \Longleftrightarrow (b^{-1}a)\cdot x=y \Longleftrightarrow y\in G\cdot x \Longleftrightarrow G\cdot y=G\cdot x$$

Thus two orbits are either disjoint, or the same. It follows that the orbits form a disjoint union of X. Since $x \in X_f$ iff $|G \cdot x| = 1$, the set $X \setminus X_f$ contains all non-singleton orbits, which are disjoint. Thus by proposition 5.4, we have

$$\begin{split} |X| &= \left| X_f \right| + \sum_{i=1}^n |G \cdot x_i| \\ &= \left| X_f \right| + \sum_{i=1}^n [G : S(x_i)] \end{split}$$

Group Actions 35

Example 5.2.2

Let G be a group acting on itself by conjugation i.e. $g \cdot x = gxg^{-1}$. Then

$$\begin{split} G_f &= \left\{ x \in G \,\middle|\, gxg^{-1} = x \,\,\forall g \in G \right\} \\ &= \left\{ x \in G \,\middle|\, gx = xg \,\,\forall g \in G \right\} \\ &= Z(G) \end{split}$$

Also, for $x \in G$,

$$S(x) = \left\{g \in G \,\middle|\, gxg^{-1} = x\right\} = \left\{g \in G \,\middle|\, gx = xg\right\}$$

This set is called the *centralizer* of x and is denoted by $S(x) = C_G(x)$. Finally in this case, the orbit

$$G \cdot x = \left\{ gxg^{-1} \mid g \in G \right\}$$

is called the *conjugacy class of* x.

By Theorem 5.5,

Corollary 5.6 Class Equation

Let G be a finite group and let $\{gx_1g^{-1} \mid g \in G\},...,\{gx_ng^{-1} \mid g \in G\}$ denote the distinct non-singleton conjugacy classes, then

$$|G| = |Z(G)| + \sum_{i=1}^{n} [G: C_G(x_i)]$$

Lemma 5.7

Let p be a prime and $m \in \mathbb{N}$. Let G be a group of order p^m acting on a finite set $X \neq \emptyset$. Let X_f be defined as in Theorem 5.5. Then we have

$$|X| \equiv \left|X_f\right| \pmod{p}$$

Proof: By Theorem 5.5, we have

$$|X| = |X_f| + \sum_{i=1}^n [G:S(x_i)] \text{ with } [g:S(x_i)] > 1$$

Since $[G:S(x_i)]$ divides $|G|=p^m$ and $[G:S(x_i)]>1$. We have $p\mid [G:S(x_i)]$ for all i. It follows that $|X|\equiv \left|X_f\right|\pmod p$

Group Actions 36

Theorem 5.8

Cauchy's Theorem

Let p be a prime and G a finite group. If $p \mid |G|$, then G contains an element of order p.

Proof: Define $X=\left\{\left(a_1,...,a_p\right) \mid a_i \in G \text{ and } a_1\cdots a_p=1\right\}$. Since a_p is uniquely determined by $a_1,...,a_{p-1}$, if |G|=n, we have $|X|=n^{p-1}$. Since $p\mid n$, we have $|X|\equiv 0\pmod p$. Let the group $\mathbb{Z}_p=\left(\mathbb{Z}_p,+\right)$ acts on X by "cycling", i.e. for $k\in\mathbb{Z}_p$,

$$k \cdot (a_1, ..., a_p) = (a_{k+1}, ..., a_p, a_1, ..., a_k)$$

One can verify that this action is well defined. Let X_f be defined as in theorem 5.5. Then $\left(a_1,...,a_p\right)\in X_f$ iff $a_1=a_2=\cdots=a_p$. Clearly $(1,1,...,1)\in X_f$ and hence $\left|X_f\right|\geq 1$. Since $\left|\mathbb{Z}_p\right|=p$, by lemma 5.7, we have

$$|X_f| \equiv |X| \equiv 0 \pmod{p}$$

Since $|X_f| \equiv 0 \pmod{p}$ and $|X_f| \ge 1$. It follows that $|X_f| \ge p$. Therefore, there exists $a \ne 1$ st $(a,..,a) \in X_f$ which implies that $a^p = 1$. Since p is prime and $a \ne 1$, the order of a is p.

6 Sylow Theorems

6.1 p-groups

Definition 6.1.1

Let p be a prime. A group in which every element has order of a non-negative power of p is called a p-group

Remark

As a direct consequence of Cauchy's Theorem we have

Corollary 6.1

A finite group G is a p-group if and only if |G| is a power of p

Lemma 6.2

The center Z(G) of a non-trivial finite p-group G contains more than one element.

Proof: The class equation of G (Cor 5.6) states that

$$|G| = |Z(G)| + \sum_{i=1}^{m} [G : C_G(x_i)]$$

where $[G:C_G(x_i)]>1$. Since G is a p-group, by Cor 6.1, $p\mid |G|$. By lemma 5.7, $|Z(G)|\equiv |G|\equiv 0\pmod p$. It follows that $p\mid |Z(G)|$. Since $1\in Z(G)$ and $|Z(G)|\geq 1$, Z(G) has at least p elements.

p-groups 37

Recall

If H is a subgroup of a group G, then $N_G(H)=\left\{g\in G\,\big|\,gHg^{-1}=H\right\}$ is the *normalizer* of H in G. In particular, $H\vartriangleleft N_G(H)$.

Lemma 6.3

If H is a p-subgroup of a finite group G, then

$$[N_G(H):H] \equiv [G:H] \pmod{p}$$

Proof: Let X be the set of all left cosets of H in G. Hence |X| = [G:H]. Let H act on X by left multiplication. Then for $x \in G$, we have

$$xH \in X_f \Longleftrightarrow hxH = xH \ \forall h \in H$$

$$\iff x^{-1}hxH = H \ \forall h \in H$$

$$\iff x^{-1}Hx = H$$

$$\iff x \in N_G(H)$$

Thus $\left|X_f\right|$ is the number of costs xH with $x\in N_G(H)$ and hence $\left|X_f\right|=\left[N_G(H):H\right]$. By lemma 5.7,

$$[N_G(H):H]=\left|X_f\right|\equiv |X|=[G:H]\pmod p$$

Corollary 6.4

Let H be a p-subgroup of a finite group G. If $p \mid [G:H]$ then $p \mid [N_G(H):H]$ and $N_G(H) \neq H$.

Proof: Since $p \mid [G:H]$, by lemma 6.3, we have

$$[N_G(H):H] \equiv [G:H] \equiv 0 \pmod{p}$$

Since $p \mid [N_G(H):H]$ and $[N_G(H):H] \geq 1$, we have $[N_G(H):H] \geq p$. Thus $N_G(H) \neq H$. \square

6.2 Three Sylow Theorems

Recall

Cauchy's theorem states that if $p \mid |G|$, then G contains an element of order p. Thus $|\langle a \rangle| = p$. The following first Sylow Theorem can be viewed as a generalization of Cauchy's Theorem.

Theorem 6.5

First Sylow Theorem

Let G be a group of order p^nm where p is a prime, $n \ge 1$ and $\gcd(p,m) = 1$. Then G contains a subgroup of order p^i for all $1 \le i \le n$. Moreover, every subgroup of G of order p^i (i < n) is normal in some subgroup of order p^{i+1} .

Proof: We prove this theorem by induction on i. For i=1, since $p \mid |G|$, by Cauchy's theorem, G contains an element a of order p, i.e. $|\langle a \rangle| = p$. Suppose that the statement holds for some $1 \le i < n$.

Three Sylow Theorems

Say H is a subgroup of G of order p^i . Then $p \mid [G:H]$, by Cor 6.4, $p \mid [N_G(H):H]$ and $[N_G(H):H] \geq p, \ p \mid [G:H]$. Then by Cauchy's theorem, $N_G(H)/H$ contains a subgroup of order p. Such a group is of the form H_1/H , where H_1 is a subgroup of $N_G(H)$ containing H. Since $H \triangleleft N_G(H)$, we have $H \triangleleft H_1$. Finally, $|H_1| = |H| |H_1/H| = p^i \cdot p = p^{i+1}$.

Definition 6.2.1

A subgroup P of a group G is said to be a *Sylow p-subgroup* of G if P is a maximal p-group of G i.e. if $P \subseteq H \subseteq G$ with H a p-group, then P = H.

As a direct consequence of theorem 6.5,

Corollary 6.6

Let G be a group of order p^nm where p is a prime, $n \ge 1$ and $\gcd(p,m) = 1$. Let H be a p-subgroup of G.

- 1. *H* is a Sylow *p*-subgroup iff $|H| = p^n$
- 2. Every conjugate of a Sylow *p*-subgroup is a Sylow *p*-subgroup.
- 3. If there is only one Sylow *p*-subgroup *P*, then $P \triangleleft G$.

Theorem 6.7

Second Sylow Theorem

If H is a p-subgroup of a finite group G, and P is any Sylow p-subgroup of G, then there exists $g \in G$ such that $H \subseteq gPg^{-1}$. In particular, any two Sylow p-subgroups are conjugate.

Proof: Let X be the set of all left cosets of P in G, and let H act on X by left multiplication. By lemma 5.7, we have $\left|X_f\right| \equiv |X| = [G:P] \pmod{p}$. Since $p \nmid [G:P]$, we have $\left|X_f\right| \neq 0$. Thus there exists $gP \in X_f$ for some $g \in G$. Note that

$$\begin{split} gP \in X_f &\iff hgP = gP \quad \forall h \in H \\ &\iff g^{-1}hgP = P \quad \forall h \in H \\ &\iff g^{-1}Hg \subseteq P \\ &\iff H \subseteq gPg^{-1} \end{split}$$

If H is Sylow p-subgroup, then $|H| = |P| = |gHg^{-1}|$, thus $H = gPg^{-1}$.

Theorem 6.8

Third Sylow Theorem

If G is a finite group and p a prime with $p \mid |G|$, then the number of Sylow p-subgroups of G divides |G| and is of the form kp + 1 for some $k \in \mathbb{N} \cup \{0\}$.

Proof: By theorem 6.7, the number of Sylow p-subgroups of G is the number of conjugates of any of them, say P. This number is $[G:N_G(P)]$. Which is a divisor of |G|. Let X be the set of all Sylow p-subgroups of G and let P act on X by conjugation. Then $Q \in X_f$ iff $gQg^{-1} = Q$ for all $g \in P$. The latter condition holds iff $P \subseteq N_G(Q)$. Both P and Q are Sylow p-subgroups of G and hence $N_G(Q)$. Thus by Cor 6.6, they are conjugate in $N_G(Q)$. Since $Q \triangleleft N_G(Q)$, this can only occur if Q = P and $X_f = \{P\}$. By lemma 5.7, $|X| \equiv |X_f| \equiv 1 \pmod{p}$. Thus |X| = kp + 1 for some $k \in \mathbb{N} \cup \{0\}$.

Three Sylow Theorems

Remark

Suppose that G is a group with $|G|=p^nm$ and $\gcd(p,m)=1$. Let n_p be the number of p-subgroups of G. By the third Sylow theorem, we have $n_p\mid p^nm$ and $n_p\equiv 1(\bmod\,p)$. Since $p\nmid n_p$, we have $n_p\mid m$.

Example 6.2.1

Claim: every group of order 15 is cyclic.

Let n_p be the number of Sylow p-subgroups of G. By the third Sylow theorem, we have $n_3 \mid 5$ and $n_3 \equiv 1 \pmod{3}$. Thus $n_3 = 1$. Similarly, we have $n_5 \mid 3$ and $n_5 \equiv 1 \pmod{5}$, Thus $n_5 = 1$. It follows that there is only one Sylow 3-subgroup and Sylow 5-subgroup, say P_3 and P_5 respectively. Thus $P_3, P_5 \triangleleft G$. Consider $|P_3 \cap P_5|$, which divides 3 and 5. Thus $|P_3 \cap P_5| = 1$ and $P_3 \cap P_5 = \{1\}$. Also $|P_3 P_5| = 15 = |G|$ Thus

$$G \cong P_3 \times P_5 \cong \mathbb{Z}_3 \times \mathbb{Z}_5 \cong Z_{15}$$

Example 6.2.2

Claim: there are two isomorphism classes of groups of order 21.

Let G be a group of order $21=3\cdot 7$. Let n_p be the number of Sylow p-subgroups of G. By the third Sylow theorem, we have $n_3\mid 7$ and $n_3\equiv 1 \pmod 3$. Thus $n_3=1$ or 7. Also we have $n_7\mid 3$ and $n_7\equiv 1 \pmod 7$. Thus $n_7=1$. It follows that G has a unique Sylow 7-subgroup, say P_7 . Note that $P_7\vartriangleleft G$ and P_7 is cyclic, say $P_7=\langle x:x^7=1\rangle$. Let H be a Sylow 3-subgroup. Since |H|=3, H is cyclic and $H=\langle y:y^3=1\rangle$. Since $P_7\vartriangleleft G$, we have $yxy^{-1}=x^i$ for some 0< i< 6. It follows that

$$x = y^3 x y^{-3} = y^2 (y x y^{-1}) y^{-2} = y^2 x^i y^{-2} = y (y x^i y^{-1}) y^{-1} = y x^{i^2} y^{-1} = x^{i^3}$$

Since $x^{i^3} = x$ and $x^7 = 1$, we have $i^3 - 1 \equiv 0 \pmod{7}$. Since $0 \le i \le 6$, we have i = 1, 2, 4.

1. If i=1, then $yxy^{-1}=x$, i.e. yx=xy. Thus G is an abelian group. Since $P_3 \triangleleft G$, $P_7 \triangleleft G$, $P_3 \cap P_7 = \{1\}$ and $|G|=|P_3P_7|$, we have

$$G \cong P_3 \times P_7 \cong \mathbb{Z}_3 \times \mathbb{Z}_7 \cong \mathbb{Z}_{21}$$

2. If i = 2, then $yxy^{-1} = x^2$. Thus

$$G = \{x^i y^j : 0 \le i \le 6, 0 \le j \le 2, yxy^{-1} = x^2\}$$

3. If i = 4, then $yxy^{-1} = x^4$. Note that

$$y^{2}xy^{-2} = y(yxy^{-1})y^{-1}$$

= $yx^{4}y^{-1}$
= $x^{16} = x^{2}$

Note that y^2 is also a generator of H. Thus by replacing y by y^2 , we get back to case 2. It follows that there are two isomorphism classes of groups of order 21.

7 Finite Abelian Groups

7.1 Primary Decomposition

Notation

Let G be a group and $m \in \mathbb{Z}$ we define

$$G^{(m)} = \{ g \in G \, | \, g^m = 1 \}$$

Proposition 7.1

Let G be an abelian group. Then $G^{(m)}$ is a subgroup of G.

Proof: We have $1 = 1^m \in G^{(m)}$. Also if $g, h \in G^{(m)}$, since G is abelian, we have $(gh)^m = g^m h^m = 1$ and thus $gh \in G^{(m)}$. Finally, if $g \in G^{(m)}$, we have

$$(g^{-1})^m = g^{-m} = (g^m)^{-1} = 1$$

and thus $g^{-1} \in G^{(m)}$. By the subgroup test, $G^{(m)}$ is a subgroup of G.

Proposition 7.2

Let G be a finite abelian group with |G| = mk with gcd(m, k) = 1. Then

- 1. $G\cong G^{(m)}\times G^{(k)}$
- 2. $\left|G^{(m)}\right|=m$ and $\left|G^{(k)}\right|=k$

Proof of 1: Since G is abelian, we have $G^{(m)} \lhd (G)$ and $G^{(k)} \lhd G$. Also, since $\gcd(m,k)=1$, there exist $x,y\in \mathbb{Z}$ such that 1=mx+ky

<u>Claim</u>: $G^{(m)} \cap G^{(k)} = \{1\}$

If $g \in G^{(m)} \cap G^{(k)}$, then $g^m = 1 = g^k$. We have

$$g = g^{mx+ky} = (g^m)^x (g^k)^7 = 1$$

 $\underline{\mathit{Claim}} : G = G^{(m)} G^{(k)}$

If $g \in G$, then

$$1 = g^{mk} = (g^m)^k = (g^k)^m$$

It follows that $g^k \in G^{(m)}$ and $g^m \in G^{(k)}$. Thus

$$g=g^{mx+ky}=\left(g^k\right)^y(g^m)^x\in G^{(m)}G^{(k)}$$

Combining both claims, by Theorem 3.13, we have

$$G\cong G^{(m)}G^{(k)}$$

Proof of 2: Write $\left|G^{(m)}\right|=m'$ and $\left|G^{(k)}\right|=k'$. By (1), we have mk=|G|=m'k'

<u>Claim:</u> gcd(m, k') = 1

Suppose that $gcd(m, k') \neq 1$. Then there exists a prime p such that $p \mid m$ and $p \mid k'$. By Cauchy's

Primary Decomposition

PMATH 347 Fall 2025 JAKE EDMONSTONE

theorem, there exists $g \in G^{(k)}$ with o(g) = p. Since $p \mid m$, we have $g^m = (g^p)^{\frac{m}{p}} = 1$, i.e. $g \in G^{(m)}$. By (1), we have $g \in G^{(m)} \cap G^{(k)} = \{1\}$, which gives a contradiction since o(g) = p. Thus we have gcd(m, k') = 1. Note that since $m \mid m'k'$ and gcd(m, k') = 1, we have $m \mid m'$. Similarly, we have $k \mid k'$. Since mk = m'k', it follows that m = m' and k = k'. As a direct consequence of proposition 7.2, we have

Theorem 7.3

Primary Decomposition Theorem

Let G be a finite abelian group with $|G| = p_1^{n_1} \cdots p_k^{n_k}$ where p_1, \dots, p_k are distinct primes and $\begin{array}{l} n_1,...,n_k\in\mathbb{N}. \text{ Then we have}\\ 1.\ G\cong G^{\left(p_1^{n_1}\right)}\times\cdots\times G^{\left(p_k^{n_k}\right)}\\ 2.\ \left|G^{\left(p_i^{n_i}\right)}\right|=p_i^{n_i}\quad (1\leq i\leq k). \end{array}$

1.
$$G \cong G^{\binom{p^{n_1}}{1}} \times \cdots \times G^{\binom{p^{n_k}}{k}}$$

$$2. \left| G^{\left(p_i^{n_i}\right)} \right| = p_i^{n_i} \quad (1 \le i \le k)$$

Example 7.1.1

Let $G = \mathbb{Z}_{13}^*$. Then $|G| = 12 = 2^2 3$. Note that

$$G^{(3)} = \{ a \in \mathbb{Z}_{13}^* \mid a^3 = 1 \} = \{1, 3, 9\}$$

$$G^{(4)} = \left\{ a \in \mathbb{Z}_{13}^* \,\middle|\, a^4 = 1 \right\} = \left\{ 1, 5, 8, 12 \right\}$$

By theorem 7.3, we have

$$\mathbb{Z}_{13}^* \cong \{1, 5, 8, 12\} \times \{1, 3, 9\}$$

7.2 Structure Theorem of Finite Abelian Groups

We have seen that if |G|=p (a prime), then $G\cong C_p$. Also, if $|G|=p^2$, then $G\cong C_{p^2}$ or $G\cong C_p\times C_p$. Question How about abelian groups of order p^3 , p^4 and p^n for general $n \in \mathbb{N}$.

Proposition 7.4

Let G be a finite abelian p-group that contains only one subgroup of order p, then G is cyclic. In other words, if a finite abelian p-group G is not cyclic, then G has at least two subgroups of order p.

Proof: Let $y \in G$ be of maximum order, i.e. $o(y) \ge o(x) \ \forall x \in G$. Claim: $G = \langle y \rangle$.

Suppose that $G \neq \langle y \rangle$. Then the quotient group $G/\langle y \rangle$ is a nontrivial p-group, which contains an element z of order p by Cauchy's theorem. In particular $z \neq 1$. Consider the coset map $\pi: G \to G/\langle y \rangle$. Let $x \in G$ such that $\pi(x) = z$. Since $\pi(x^p) = \pi(x)^p = z^p = 1$, we see that $x^p \in \langle y \rangle$. Thus $x^p = y^m$ for some $m \in \mathbb{Z}$. Two cases:

- 1. If $p \nmid m$ since $o(y) = p^r$ for some $r \in \mathbb{N}$, by prop 2.11, $o(y^m) = o(y)$. Since y is of maximum order, we have $o(x^p) < o(x) \le o(y) = o(y^m) = o(x^p)$ which is a contradiction.
- 2. If $p \mid m$, then m = pk for some $k \in \mathbb{Z}$. Thus we have $x^p = y^m = y^{pk}$. Since G is abelian, we have $(xy^{-k})^p = 1$. Thus xy^{-k} belongs to the one and only subgroup of order p, say H. On the other hand, the cyclic group $\langle y \rangle$ contains a subgroup of order p, which must be the one and only H. Thus $xy^{-k} \in \langle y \rangle$, which implies that $x \in \langle y \rangle$. It follows that $z = \pi(x) = 1$, a contradiction.

By combining the above two cases, we see that $G = \langle y \rangle$.

Proposition 7.5

Let $G \neq \{1\}$ be a finite abelian p-group. Let C be a cyclic subgroup of maximum order. Then G contains a subgroup B such that

$$G = CB$$
 and $C \cap B = \{1\}$

Theorem 7.6

Let $G \neq 1$ be a finite abelian p-group. Then G is isomorphic to a direct product of cyclic groups.

Proof: By prop 7.5, there exists a cyclic group C_1 and a subgroup B_1 of G such that $G \cong C_1 \times B_1$. Since $|B_1| \mid |G|$ by Lagrange's theorem, the group B_1 is also a p-group. Thus if $B_1 \neq \{1\}$, by prop 7.5, there exists a cyclic group C_2 and a subgroup B_2 such that $B_1 \cong C_2 \times B_2$. Continue in this way to get cyclic groups $C_1, ..., C_k$ until we get $B_k = \{1\}$ for some $k \in \mathbb{N}$. Then $G \cong C_1 \times \cdots \times C_k$.

Remark

One can show that the decomposition of a finite abelian p-group into a direct product of cyclic groups is unique up to its order.

Combining the remark, theorem 7.6 and theorem 7.3, we have

Theorem 7.7

Structure Theorem of Finite Abelian Groups

If G is a finite abelian group, then

$$G\cong \mathbb{Z}_{p_1^{n_1}}\times \cdots \times \mathbb{Z}_{p_k^{n_k}}$$

Where $\mathbb{Z}_{p_i^{n_i}} = \left(\mathbb{Z}_{p_i^{n_i}}, +\right) \cong C_{p_i^{n_i}}$ are cyclic groups of order $p_i^{n_i}$ $(1 \leq i \leq k)$. Note that p_i are not necessarily distinct. The numbers $p_i^{n_i}$ are uniquely determined up to their order.

Note that if p_1 and p_2 are distinct primes, then $C_{p_1^{n_1}} \times C_{p_2^{n_2}} \cong C_{p_1^{n_1}p_2^{n_2}}$. Thus by combining suitable coprime factors together,

Theorem 7.8

Invariant Factor Decomposition of Finite Abelian Groups

Let G be a finite abelian group. Then

$$G\cong \mathbb{Z}_{n_1}\times \cdots \times \mathbb{Z}_{n_r}$$

where $n_i \in \mathbb{N}, n_1 > 1$ and $n_1 \mid n_2 \mid \dots \mid n_r$.

Example 7.2.1

Let g be an abelian group of order 48. Since $48=2^4\cdot 3$, by theorem 7.3, $G\cong H\times \mathbb{Z}_3$, where H is an abelian group of order 2^4 . The options for H are $\mathbb{Z}_{2^4},\mathbb{Z}_{2^3}\times \mathbb{Z}_2,\mathbb{Z}_{2^2}\times \mathbb{Z}_{2^2}\times \mathbb{Z}_2\times \mathbb{Z}_2$ and $\mathbb{Z}_2\times \mathbb{Z}_2\times \mathbb{Z}_2\times \mathbb{Z}_2$. Thus we have

$$\begin{split} G &\cong \mathbb{Z}_{2^4} \times \mathbb{Z}_3 \cong \mathbb{Z}_{48} \\ G &\cong \mathbb{Z}_{2^3} \times \mathbb{Z}_2 \times \mathbb{Z}_3 \cong \mathbb{Z}_2 \times \mathbb{Z}_{24} \\ G &\cong \mathbb{Z}_{2^2} \times \mathbb{Z}_{2^2} \times \mathbb{Z}_3 \cong \mathbb{Z}_{2^2} \times \mathbb{Z}_{12} \\ G &\cong \mathbb{Z}_{2^2} \times \mathbb{Z}_2 \times \mathbb{Z}_2 \times \mathbb{Z}_3 \cong \mathbb{Z}_2 \times \mathbb{Z}_2 \times \mathbb{Z}_{12} \\ G &\cong \mathbb{Z}_2 \times \mathbb{Z}_2 \times \mathbb{Z}_2 \times \mathbb{Z}_2 \times \mathbb{Z}_3 \cong \mathbb{Z}_2 \times \mathbb{Z}_2 \times \mathbb{Z}_2 \times \mathbb{Z}_2 \times \mathbb{Z}_2 \\ \end{split}$$

There are 5 non-isomorphic groups in total.
